

Circuit Description of WT-359

RECEIVER:

Signal from antenna, then frequency 49.860MHz selected by the core T1, high frequency amplified and demodulated at Q2, then sent to IC2 by C30 R21 C25 to be audio amplified, then make the speaker work.

SEND:

Sound from MIC, Audio amplified at IC2, then modulate the signal 49.860MHz at high frequency oscillator Q2, then sent by the antenna.
