FCC ID/IC	MQO-TAP900-01/ 2570A-TAP90001	Test Report Date	August 7, 2013
Platform	N/A	RTL Work Order #	2013095
Model #'s	TAP910-01, TAP920-01, TAP930-01	RTL Quote #	QRTL13-095A
American National Standard Institute	ANSI C63.4-2003 Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz		
FCC Classification	NII - Unlicensed National Information Infrastructure		
FCC Rule Part(s)	FCC Rules Part 15.407 (Subpart E): Unlicensed National Information Infrastructure Devices (10-01-12)		
Industry Canada	RSS-210 Issue 8: Low Power License-Exempt Communications Devices		
Digital Interface Information	Digital Interface was found to be compliant		
Frequency Range (MHz)	Output Power (W)	Frequency Tolerance	Emission Designator
5180-5240	0.005	N/A	25M2G7D
5260-5320	0.028	N/A	27M5G7D
5500-5700	0.032	N/A	32M0G7D

I, the undersigned, hereby declare that the equipment tested and referenced in this report conforms to the identified standard(s) as described in this test report. No modifications were made to the equipment during testing in order to achieve compliance with these standards. Furthermore, there was no deviation from, additions to, or exclusions from, the applicable parts of FCC Part 2, FCC Part 15, ANSI C63.4, and Industry Canada RSS-210.

Signature: 

Date: August 7, 2013

Typed/Printed Name: Desmond A. Fraser

Position: President

These tests are accredited and meet the requirements of ISO/IEC 17025 as verified by ANSI-ASQ National Accreditation Board/ACLASS. Refer to certificate and scope of accreditation AT-1445.

This report may not be reproduced, except in full, without the written approval of Rhein Tech Laboratories, Inc. and Vocollect, Inc. The test results relate only to the item(s) tested.

1 General Information

1.1 Scope

Applicable Standards:

- FCC Rules Part 15E: Unlicensed National Information Infrastructure Devices
- Industry Canada RSS-210: Low Power License-Exempt Communications Devices

1.2 Description of EUT

Equipment Under Test	A700 Series Terminal
Models	TAP910-01, TAP920-01, TAP930-01
Power Supply	Battery operated
Modulation Type	DSSS, OFDM
Transfer Rate	1, 2, 5.5, 11, 6, 12, 18, 24, 36, 48, 54
Frequency Range	5180 – 5320; 5500 - 5700 MHz
Antenna Connector Type	Internal
Antenna Types	Internal

Note that the EUT is a slave/client device with no ad-hoc capabilities.

1.3 Test Facility

The open area test site and conducted measurement facility used to collect the radiated data is located at 360 Herndon Parkway, Suite 1400, Herndon, Virginia 20170. This site has been fully described in a report and approved by the Federal Communications Commission to perform AC line conducted and radiated emissions testing (ANSI C63.4 2003).

1.4 Related Submittal(s)/Grant(s)

This is an original certification application for Vocollect, Inc. A700 Series Terminal, Model #'s: TAP910-01, TAP920-01, TAP930-01, FCC ID: MQO-TAP900-01, IC: 2570A-TAP90001. IC will require a family certification.

The three models are electrically identical from an intentional radiator standpoint. The differences in the three models are the end caps, and only impact digital unintentional emissions. RF exposure (SAR) has been addressed for all three models individually.

1.5 Modifications

No modifications were required for compliance.

2 Test Information

2.1 Description of Test Modes

In accordance with FCC 15.31(m), and because the EUT utilizes an operating band greater than 10 MHz, the following frequencies were tested:

Table 2-1: Channels Tested - 802.11a (54 Mbps)

Channel	Frequency (MHz)
36	5180
40	5200
48	5240
52	5260
60	5300
64	5320
100	5500
116	5580
140	5700

2.2 Exercising the EUT

The EUT was tested in all three orthogonal planes in order to determine worst-case emissions. The EUT was provided with software to continuously transmit during testing. The carrier was also checked to verify that information was being transmitted. There were no deviations from the test standard(s) and/or methods. The test results reported relate only to the item tested.

2.3 Test Result Summary

Table 2-2: Test Result Summary – FCC Part 15, Subpart E (Section 15.407)

Standard	Test	Pass/Fail or N/A
FCC 15.407(a)/1/2/3)	Peak Transmit Power Measurement	Pass
FCC 15.407(a)(6)	Peak Power Excursion Measurement	Pass
FCC 15.407(a)/1/2/3)	Peak Power Spectral Density Measurement	Pass
FCC 15.407(g)	Frequency Stability Measurement	Pass
FCC 15.407(7), 15.205	Compliance With the Band Edge	Pass
FCC 15.407(6)(b)	Antenna Conducted Spurious Emissions	Pass
FCC 15.407(a)	26 dB Bandwidth	Pass
FCC 15.209	Radiated Emissions	Pass
FCC 15.207	Conducted AC Emissions	Pass

2.4 Test System Details

The test sample was received on June 17, 2013. The FCC identifiers for all applicable equipment, plus descriptions of all cables used in the tested system, are identified in the following tables.

Table 2-3: Equipment Under Test

Part	Manufacturer	Model	Serial Number	FCC ID	Cable Description	RTL Bar Code
A700 Series Terminal	Vocollect, Inc.	TAP-910-01	6213270002	MQO-TAP900-01	N/A	21214
A700 Series Terminal	Vocollect, Inc.	TAP-920-01	6213234004	MQO-TAP900-01	N/A	21212
A700 Series Terminal	Vocollect, Inc.	TAP-930-01	5913224022	MQO-TAP900-01	N/A	21222
3.7VDC Lithium Ion Battery	Vocollect, Inc.	BT-902 (730044)	351309002900	N/A	N/A	21213
3.7VDC Lithium Ion Battery	Vocollect, Inc.	BT-902 (730044)	351309005500	N/A	N/A	21239
3.7VDC Lithium Ion Battery	Vocollect, Inc.	BT-902 (730044)	351228002500	N/A	N/A	21236

Table 2-4: Support Equipment

Part	Manufacturer	Model	Serial Number	FCC ID	Cable Description	RTL Bar Code
Headset	Vocollect, Inc.	N/A	N/A	N/A	N/A	20904

2.5 Configuration of Tested System

Figure 2-1: Configuration of System Under Test

3 Peak Transmit Power Measurement – FCC 15.407(a/1/2/3); RSS-210 A9.2

3.1 Power Output Test Procedure

Method SA-1 789033 D01 General UNII Test Procedures v01r03

Table 3-1: Power Output Test Equipment

RTL Asset #	Manufacturer	Model	Part Type	Serial Number	Calibration Due Date
901583	Agilent Technologies	N9010A	EXA Signal Analyzer (10 Hz - 26.5 GHz)	MY51250846	4/16/14
900948	Weinschel Corporation	47-10-43	Attenuator DC-18 GHz 10 dB 50W	BH1487	3/18/14

3.2 Power Output Test Data

Table 3-2: Power Output Test Data

Channel	Frequency (MHz)	Maximum Conducted Output Power (dBm)
36	5180	7.1
40	5200	7.0
48	5240	7.0
52	5260	14.5
60	5300	14.3
64	5320	14.3
100	5500	14.9
116	5580	15.0
140	5700	14.4

3.3 Limits of Maximum Transmit Power Measurement

Frequency Band	Limit
5.15-5.25GHz	The lesser of 50 mW (17 dBm) or 4 dBm+10logB (14+4)
5.25-5.35GHz	The lesser of 250 mW (24 dBm) or 11 dBm+10logB (14.4+11)
5.725-5.825GHz	The lesser of 1 W (30 dBm) or 17 dBm+10logB (15+17)

Test Personnel:

Daniel W. Baltzell		July 25, 2013
Test Engineer	Signature	Date of Test

4 Peak Power Excursion Measurement – FCC 15.407(a)(6)

4.1 Limits of Peak Power Excursion

Frequency Band	Limit
5.15-5.25 GHz	13 dB
5.25-5.35 GHz	13 dB
5.725-5.825 GHz	13 dB

4.2 Peak Power Excursion Measurement Test Procedure

1. The transmit output was connected to a spectrum analyzer.
2. Span was set to the entire emission bandwidth of signal.
3. Using peak detector and max hold function for trace 1, and average detector for trace 2, the RBW was set to 1 MHz and VBW to 3 MHz.
4. The delta measurement was recorded between the largest difference between the traces in any 1 MHz band for each modulation rate/type using channel 60, 5300 MHz.

Table 4-1: Peak Power Excursion Measurement Test Equipment

RTL Asset #	Manufacturer	Model	Part Type	Serial Number	Calibration Due Date
901583	Agilent Technologies	N9010A	EXA Signal Analyzer (10 Hz - 26.5 GHz)	MY51250846	4/16/14
900948	Weinschel Corporation	47-10-43	Attenuator DC-18 GHz 10 dB 50W	BH1487	3/18/14

5 Peak Power Spectral Density Measurement – FCC 15.407(a/1/2/3); RSS-210 A9.2

5.1 Limits of Peak Power Spectral Density

Frequency Band	Limit
5.15-5.25 GHz	4 dBm
5.25-5.35 GHz	11 dBm
5.725-5.825 GHz	17 dBm

5.2 Peak Power Spectral Density Measurement Test Procedure

1. The transmitter output was connected to a spectrum analyzer
2. RBW was set to 1 MHz and VBW to 3 MHz. The highest level PPSD was measured across the emission in any 1 MHz band.

Table 5-1: Peak Power Spectral Density Measurement Test Equipment

RTL Asset #	Manufacturer	Model	Part Type	Serial Number	Calibration Due Date

6 Frequency Stability Measurement – FCC 15.407(g)

6.1 Limits of Frequency Stability

The frequency tolerance of the CW shall be maintained within +/-0.02% of the operating frequency over a temperature variation of -30° C to 50° C at normal supply voltage, and for a variation in the primary supply voltage from 85%-115% of the rated supply voltage at a temperature of 20° C.

6.2 Frequency Stability Measurement Test Procedure

The EUT was placed inside temperature chamber and supplied by nominal 3.7 VDC. The EUT was connected to an analyzer which was located outside of test chamber. The temperature was set to the lowest level and the EUT was allowed to stabilize with power off for a period of 30 minutes. The EUT was then powered up and the frequency of the CW was measured. This was continued in 10 degree steps to the highest temperature level of 50° C was measured. The chamber was allowed to stabilize between measurements for approximately 30 minutes. The EUT supply voltage was then adjusted to 85% and 115% of nominal voltage and the frequency was again recorded and finally normalized to 20° C.

7 Compliance With the Band Edge – FCC 15.407(b)(7), 15.205; RSS-210 A9.3

7.1 Limits of Band Edge Measurement

Below -20 dB of the highest emission level of operating band (in 100 kHz resolution bandwidth).

7.2 Band Edge Test Procedure

The transmitter output was connected to a spectrum analyzer through a low loss cable. The RBW was set to 1 MHz and the VBW was set to 1 MHz with a suitable span including 100 MHz bandwidth from band edge.

For signals in the restricted band above and below 5150 and 5350 MHz, a measurement of the amplitude of the spurious emissions was made with respect to the intentional signal. The relative amplitude, in dBc, was applied to the average measurement using the peak field strength which was measured on the OATS site to calculate the field strength of the unintentional signals.

Table 7-1: Band Edge Test Equipment

RTL Asset #	Manufacturer	Model	Part Type	Serial Number	Calibration Due Date
901583	Agilent Technologies	N9010A	EXA Signal Analyzer (10 Hz - 26.5 GHz)	MY51250846	4/16/14

7.3 Restricted Band Edge Test Results

7.3.1 Calculation of Lower Band Edge

86.8 dBuV/m is the field strength measurement, from which the delta measurement of 55.3 dB is subtracted (reference plots), resulting in a level of 31.5 dB. This level has a margin of 22.5 dB below the limit of 54 dBuV/m.

Calculation: $86.8 \text{ dBuV/m} - 55.3 \text{ dB} - 54 \text{ dBuV/m} = -22.5 \text{ dB}$

Field strength of Lower Band Edge (Average) = 100.9 dBuV/m

Field strength of Lower Band Edge (Peak) = 86.8 dBuV/m

Delta measurement = 55.3 dB

Plot 7-1: Lower Band Edge: Measurement Channel 36 (TX Frequency: 5180 MHz)

7.3.2 Calculation of Upper Band Edge

92.3 dBuV/m is the field strength measurement, from which the delta measurement of 44.7 dB is subtracted (reference plots), resulting in a level of 47.6 dB. This level has a margin of 6.4 dB below the limit of 54 dBuV/m.

Calculation: $92.3 \text{ dBuV/m} - 44.7 \text{ dB} - 54 \text{ dBuV/m} = -6.4 \text{ dB}$

Field strength of Lower Band (Average) = 106.6 dBuV/m

Field strength of Lower Band (Peak) = 92.3 dBuV/m

Delta measurement = 44.7 dB

Plot 7-2: Upper Band Edge: Measurement Channel 64 (TX Frequency: 5320 MHz)

7.3.3 Calculation of Lower Band Edge

92.7 dBuV/m is the field strength measurement, from which the delta measurement of 44 dB is subtracted (reference plots), resulting in a level of 48.7 dB. This level has a margin of 6.3 dB below the limit of 54 dBuV/m.

Calculation: $92.7 \text{ dBuV/m} - 44 \text{ dB} - 54 \text{ dBuV/m} = -6.3 \text{ dB}$

Field strength of Lower Band (Average) = 107.3 dBuV/m

Field strength of Lower Band (Peak) = 92.7 dBuV/m

Delta measurement = 44 dB

Plot 7-3: Lower Band Edge: Peak Measurement Channel 100 (TX Frequency: 5500 MHz)

7.3.4 Upper Band Edge

Plot 7-4: Upper Band Edge Measurement Channel 140 (TX Frequency: 5700 MHz)

8.3 Limits of Undesirable Emissions

(b) *Undesirable emission limits:* Except as shown in paragraph (b)(6) of this section, the peak emissions outside of the frequency bands of operation shall be attenuated in accordance with the following limits:

- (1) For transmitters operating in the 5.15–5.25 GHz band: all emissions outside of the 5.15–5.35 GHz band shall not exceed an EIRP of –27 dBm/MHz.
- (2) For transmitters operating in the 5.25–5.35 GHz band: all emissions outside of the 5.15–5.35 GHz band shall not exceed an EIRP of –27 dBm/MHz. Devices operating in the 5.25–5.35 GHz band that generate emissions in the 5.15–5.25 GHz band must meet all applicable technical requirements for operation in the 5.15–5.25 GHz band (including indoor use) or alternatively meet an out-of-band emission EIRP limit of –27 dBm/MHz in the 5.15–5.25 GHz band.
- (3) For transmitters operating in the 5.47–5.725 GHz band: all emissions outside of the 5.47–5.725 GHz band shall not exceed an EIRP of –27 dBm/MHz.

10 Radiated Emissions – FCC 15.209; RSS-Gen

10.1 Limits of Radiated Emissions Measurement

Frequency (MHz)	Field Strength (uV/m)	Measurement Distance (m)
0.009-0.490	2400/f (kHz)	300
0.490-1.705	2400/f (kHz)	30
1.705-30.0	30	30
30-88	100	3
88-216	150	3
216-960	200	3
Above 960	500	3

As shown in 15.35(b), for frequencies above 1000 MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits, specified above by more than 20 dB under any circumstances of modulation.

10.2 Radiated Emissions Measurement Test Procedure

Before final measurements of radiated emissions were made on the open-field three/ten meter range, the EUT was scanned indoors at one and three meter distances. This was done in order to determine its emissions spectrum signature. The physical arrangement of the test system and associated cabling was varied in order to determine the effect on the EUT's emissions in amplitude, direction and frequency. This process was repeated during final radiated emissions measurements on the open-field range, at each frequency, in order to ensure that maximum emission amplitudes were attained.

Final radiated emissions measurements were made on the three/ten-meter, open-field test site. The EUT was placed on a nonconductive turntable 0.8 meters above the ground plane. The spectrum was examined from 9 kHz to the 10th harmonic of the highest fundamental transmitter frequency (24.8 GHz).

At each frequency, the EUT was rotated 360°, and the antenna was raised and lowered from 1 to 4 meters in order to determine the emission's maximum level. Measurements were taken using both horizontal and vertical antenna polarizations. For frequencies between 30 and 1000 MHz, the spectrum analyzer's 6 dB bandwidth was set to 120 kHz, and the analyzer was operated in the CISPR quasi-peak detection mode. For emissions above 1000 MHz, emissions are measured using the average detector function with a minimum resolution bandwidth of 1 MHz. No video filter less than 10 times the resolution bandwidth was used. The highest emission amplitudes relative to the appropriate limit were measured and recorded in this report.

11 Conducted Emissions - FCC Rules and Regulations Part 15.207; RSS-Gen 7.2.2

11.1 Site and Test Description

The power line conducted emissions measurements were performed in a Series 81 type shielded enclosure manufactured by Rayproof. The EUT was assembled on a wooden table 80 centimeters high. Power was fed to the EUT through a 50-ohm/50 microhenry Line Impedance Stabilization Network (LISN). The EUT LISN was fed power through an A.C. filter box on the outside of the shielded enclosure. The filter box and EUT LISN housing are bonded to the ground plane of the shielded enclosure. A second LISN, the peripheral LISN, provides isolation for the EUT test peripherals. This peripheral LISN was also fed A.C. power. A metal power outlet box, which is bonded to the ground plane and electrically connected to the peripheral LISN, powers the EUT host peripherals.

The spectrum analyzer was connected to the AC line through an isolation transformer. The 50-ohm output of the EUT LISN was connected to the spectrum analyzer input through a Solar 100 kHz high-pass filter. The filter is used to prevent overload of the spectrum analyzer from noise below 100 kHz. Conducted emission levels were measured on each current-carrying line with the spectrum analyzer operating in the CISPR quasi-peak mode (or peak mode if applicable).

The analyzer's 6 dB bandwidth was set to 9 kHz. Video filter less than 10 times the resolution bandwidth is not used. Average measurements are performed in linear mode using a 10 kHz resolution bandwidth, a 1 Hz video bandwidth, and by increasing the sweep time in order to obtain a calibrated measurement. The emission spectrum was scanned from 150 kHz to 30 MHz. The highest emission amplitudes relative to the appropriate limits were measured and have been recorded.

11.2 Test Limits

Line-Conducted Emissions		
Limit (dBµV)		
Frequency (MHz)	Quasi-Peak	Average
0.15 to 0.50	66 to 56	56 to 46
0.50 to 5.00	56	46
5.00 to 30.00	60	50

12 Conclusion

The data in this measurement report shows that the EUT as tested, Vocollect, Inc. A700 Series Terminal, Model #'s TAP910-01, TAP920-01, and TAP930-01, FCC ID: MQO-TAP900-01, IC: 2570A-TAP90001, complies with all the applicable requirements of Parts 2 and 15 of the FCC Rules and Regulations and Industry Canada RSS-210.
