Technical Description TPMS (Tire Pressure Monitoring System) ECU

Overview

The TPMS ECU will serve as the interface between TPMS Transmitters and the CAN communications bus within the vehicle. The TPMS ECU will receive RF transmissions from the Transmitters. It will decode and analyse these transmissions and provide data on the tyre pressure and temperature and location for each wheel on the vehicle. Based on the data from the Transmitter, the TPMS ECU will report hard warnings and soft warnings and tyre pressures over the CAN bus depending on the customers algorithm.
