

Re : Descriptions for Computer Applications

Please find here below the descriptions for Internetphone applications :

"If applying uses of the headset phone system with computer for Internet Phone conversation, move the switch on front of the baseset from 'TELEPHONE' to 'COMPUTER' and connect speaker and mic jacks on the back of baseset with respective jacks in sound card of computer by speaker and mic cable. After then, the headset will work as communication tool once Internet Phone Software is activated.

The switch should be moved back from 'COMPUTER' to 'TELEPHONE' for general telephone function."

CIRCUIT DESCRIPTION

1. HANDSET

1.1 RECEPTION

Figure 1

As shown in figure 1, the received signal from the base unit passes through 927 MHz Filter and amplified by RF Amplifier (Q8). The amplified input signal is mixed with RX VCO (Q4,L1,D1) signal.

The VCO oscillation is controlled by error signals from PLL IC pin no. 10. The channel information to PLL IC is provided by Microprocessor IC (ICD1) pin nos. 25, 26 and 30. (Serial data outputs).

The Mixer output from Q3 passes through 10.7 MHz Ceramic Filter (FL2) and enters to FM Demodulator IC pin no. 16. This signal mixes with 11.150 MHz signal from PLL IC pin no. 11, which is connected to IC2 pin no.1. The mixed signal is filtered by 450 KHz Filter (FL4).

1.2 RINGER OUTPUT

Figure 2

After detection of ring signal, the base unit will transmit the data code signal including security code to handset.

As shown in figure 2, the demodulated ring signal from pin no. 9 of FM Demodulator IC2 is fed to low pass filter and amplified by RX Data Amplifier and its output is connected to RX Data port of Microprocessor IC (ICD1).

The ring signal output from pin no. 9 of Microprocessor IC (ICD1) goes to buzzer driver Q9 to activate the buzzer.

1.3 VOICE OUTPUT

Figure 3

The demodulated signal, resulting from Double Super Heterodyne system, which appears at output pin no. 9 of IC2 is connected to pin no. 16 Expander input of Compander IC (IC3A) for expansion. The expanded audio output from IC3A pin no. 19 is finally amplified by Q10 and A.C. coupled to the receiver unit with Hearing Aid Compatibility (HAC).

1.4 DATA TRANSMISSION

Figure 4

As shown in figure 4, the TX data code output including security code from ICD1 pin no. 28 is connected to TX VCO for modulation. The data code signal is modulated with the carrier frequency generated by the RF oscillator (Q5). The oscillator frequency is controlled by the error signal from pin no.3 of PLL IC (IC1). The modulated signal is amplified by RF amplifier stage (Q5) and then passes through 927MHz filter stage (F2). The FM modulated signal is radiated by the handset Rubberized Antenna.

1.5 VOICE TRANSMISSION

Figure 5

Voice signal from condenser mic is coupled to pin no. 8 of Compander IC (IC3B). The voice signal is compressed by IC3B and then connected to TX VCO stage for modulation.

1.6 RECEIVER POWER CONTROL

- When at STANDBY mode and RING ON mode the handset has 50 ms power on and 800ms power off on receiver section.
- When at STANDBY mode and SAVE ON mode, the handset have no power on receiver section.
- The power saving is controlled by Microprocessor IC (ICD1) pin no. 18 (RX power control) and Q6.

1.7 TRANSMITTER POWER CONTROL

- When at TALK mode, the handset transmitter should be working.
- The transmitter power is controlled by Microprocessor IC (ICD1) pin no. 17 (TX power control) and Q11.

1.8 BATTERY LOW DETECTOR

- When the battery voltage goes down until 3.3 to 0.1 Vdc, the LED1 will flash with warning sound "Bi, Bi".

1.9 BATTERY CHARGING

Figure 6

- When the handset is placed on the base unit cradle, the battery will be charging and will be detected by Microprocessor IC (IC1) pin no.15.
- Microprocessor IC will exchange security code randomly.

1.10 SQUELCH

Figure 7

As shown in figure 7, the audio output (noise output) from FM Demodulator IC (IC2) pin no.9 goes to pin no. 10 (Noise filter input) and the output from pin no. 11 will enter to pin no. 12 to activate the squelch control of IC2. The output from pin no. 13 is connected to the Microprocessor IC (ICD1) for RSSI Detection.

NOTE :

- When the handset is far away from the base unit, squelch circuit of IC1 operates and pin no. 13 of IC1 goes 'HI'. This will be detected by Microprocessor and after 10 seconds, it goes to standby mode.

2. BASE UNIT

2.1 RECEPTION

Base receiver circuit is similar to handset receiver circuit description as shown in figure 1. The difference with section 1.1 are local frequency and receiving frequency as describe below.

The received signal from the handset unit passes through 927 MHz filter and amplified by RF RF Amplifier (Q8). The amplified signal is mixed with RX VCO (Q4,L1, D1).

The mixer output from Q3 passes through 10.7 MHz filter and enters to FM Demodulator IC (IC2) pin no. 16. This signal is mixed with 11.150 MHz signal from PLL IC (IC1) pin no.9, which is connected to IC2 pin no. 1. The mixed signal is filtered by 450 KHz Filter (FL4).

2.2 DATA INPUT

The demodulated data code from FM Demodulator IC (IC2) pin no. 9 is fed to Lowpass filter and its output is connected to code input of Microprocessor IC (IC1).

2.3 AUDIO OUTPUT

As shown in figure 8, the demodulated signal which appears at output pin of FM Demodulator IC (IC2) pin no. 9 is sent through lowpass filter to Compander IC (IC4A) pin no. 16 (Expander input) for expansion. The expanded audio signal output from IC4A pin no. 19 is coupled to Buffer Amplifier (Q15,Q16) during the CONVERSATION mode. The audio is sent to telephone line via Hybrid X'former (HYB1).

Figure 8

2.4 DATA TRANSMISSION

Refer to figure 4., the difference is that the TX Data is transmitted from pin 10 of Microprocessor IC (IC1).

2.5 VOICE TRANSMISSION

Figure 9

The audio signal receiving from telephone line is input to Compander IC (IC4B) pin no. 8 for compression. The compressed audio signal from pin no.1 of IC4B is connected to TX VCO for modulation. The signal is modulated with the carrier frequency of the oscillator (Q7), the oscillator frequency is controlled by the error signal from pin 3 of PLL IC. The modulated signal is amplified by RF Amplifier stage (Q5) and then passes through 903 MHz filter stage (F2). The FM modulated signal is radiated by the base unit antenna.

2.6 DTMF OUT

Figure 10

DTMF dialing is generated in pin no. 34 of Microprocessor IC (IC1) and output of IC3C DTMF filter. (low pas filter and high pas filter)

2.7 TRANSMITTER POWER CONTROL

Transmit power is controlled by IC1 pin 17 and Q8 .

2.8 RINGER DETECT

Figure 11

The ring signal from the telephone line is detected by Photocoupler (IC5) and the output from IC5 will be coupled to Microprocessor IC (IC1) pin no.42. After detection of ring signal, the microprocessor will send the data code to handset.

2.9 PULSE DIAL

During pulse dialing, IC1 CPU pin 14 will be sending pulse dial signal to Relay trigger (Q10) then goes to telephone line.

2.10 CHARGE DETECT

Figure 12

When the handset is on cradle, Q1 is activated and Microprocessor IC (IC1) pin 43 will detect the charging then it will exchange security code randomly.

2.11 SQUELCH

Refer to section 1.10. Squelch operation is same as handset as shown in figure 7.

2.12 RESET

When handset is place on cradle (charge) or insert the power plug into the socket, Base will reset automatically.

40 CHANNEL - AUTOMATIC CHANNEL SELECTION MECHANISM
MODEL: CT-430

During the activation of Talk, the Handset receiver scans for free channel from its last linked receiver channel (about 50ms per channel). Once a free channel is found, the Handset transmits the Talk instruction to Base together with the receiver's free channel information for the Base to use this free channel as the Transmit channel.

Likewise, the Base receiver continuously scans each channel (25ms per channel) and stores all free channels into its memory. Once the Base receiver received the instruction from its Handset, it will stop from scanning and transmits its acknowledgement data with the Base receiver free channel information. When the Handset receives this Base free channel information, it will transmit the link command to Base and both will link on the clearest channel. The Handset and Base scan and find their receiver's clearest channel separately. If all transmit channels of Handset and Base are occupied (all busy), Handset and Base will link on the default channel (Channel 20).
