

Operation Description

This transmitter is intended to use for detecting the location or position of the object on which the transmitter was install.

When the power is on, the transmitter will transmit RF Signal one time to identify itself. Then it goes into the alert mode. There are two conditions to trigger the transmitter. The first one is shock, when shocks are happened, the transmitter will transmit one time of RF Signal less than 1 seconds to warn the shocks. The second one is the connected pin was taken off. The transmitter will transmit RF Signal five times within 40 seconds (one transmission per 10 seconds, and each transmission is less than 1 second) and then shuts down all transmissions.
