3 General Product Information

3.1 Product Function and Intended Use

The equipment under test (EUT) is a RC toy car operating at 49.860MHz. The forward, backward, left and right movement are controlled by the associated transmitter.

The manufacturer declares that 9373 / 9374 / 9375 are same in circuit design and PCB layout, they only differ in the cosmetic design.

FCCID: NEX-9374-75-49

Model	**Product description**
9373	R/C-IS300- X'TREME TUNERS
9374	R/C- TOYOTA-SUPRA - X'TREME TUNERS
9375	R/C -MITSUBISHI-LANCER EVOLUTION VII -X'TREME TUNERS

3.2 Circuit Description

1) Q1 and the associated circuit act as a RF-receiver.
2) IC1 and the associated circuit act an AF amplifier.
3) Q2-Q17 and the associated circuit act as a power amplifier for DC motor.

3.3 Ratings and System Details

		Receiver
Frequency range	:	49.860MHz
Number of channels	:	1
Type of antenna	:	Permanently attached receiving antenna.
Power supply	:	Battery operated : 4 x 1.5V "AA" sze batteries.
Ports	:	none
Protection Class	:	III

3.4 Independent Operation Modes

The basic operation modes are:

- Power: On and Off
- Motor movement: left and right, forward and backward.

For further information refer to User Manual

3.5 Submitted Documents

The submitted documents are listed as follow:

- Circuit diagram
- Block diagram
- Rating lable
- User manual

3.6 Related Submittal(s) Grants

This is a single application for certification of the receiver, the transmitter for this receiver is authorized by the Certification procedure.

4 Test Set-up and Operation Mode

4.1 Principle of Configuration Selection

Emission: The equipment under test (EUT) was configured to measure its highest possible radiation level. The test modes were adapted accordingly in reference to the instructions for use.

4.2 Test Operation and Test Software

Test operation should refer to Section 5 and 7.

- There was no special software to exercise the device.

4.3 Special Accessories and Auxiliary Equipment

The product has been tested together with the following additional accessories:

-none

4.4 Countermeasures to achieve EMC Compliance

The test sample, which has been tested, contained the noise suppression parts as described in the Circuit Diagram or the Technical Construction File. No additional measures were employed to achieve compliance.

5 Test Methodology

Radiated Emission

The radiated emission measurements were performed according to the procedures in ANSI C63.4-1992.

The equipment under test (EUT) was placed at the middle of the 80cm height turntable, and the turntable is 3 meters far from the measuring antenna. During the testing, the EUT was operated standalone and arranged for maximum emissions. The EUT was tested in three orthogonal planes.

The investigation is performed with the EUT rotated 360° , the antenna height scanned between 1m and 4m, and the antenna rotated to repeat the measurements for both the horizontal and vertical antenna polarizations. Repeat the measurement steps until the maximum emissions were obtained.

The frequency range scanned is from the lowest radio frequency signal generated in the device which greater than 9 KHz to the tenth harmonic of the higest fundamental frequency or 40GHz, whichever is lower.

All radiated tests were performed at an antenna to EUT with 3 meters distance, unless stated otherwise in section 7.1.1 of this test report.

6 Field Strength Calculation

The field strength at 3m was established by adding the meter reading of the spectrum analyzer to the factors associated with antenna correction factor, cable loss, preamplifiers and filter attenuation.

The equation is expressed as follow:

FS = R + AF + CF + FA – PA

Where FS = Field Strength in dBuV/m at 3 meters.
R = Reading of Spectrum Analyzer in dBuV.
AF = Antenna Factor in dB.
CF = Cable Attentuation Factor in dB.
FA = Filter Attenutaion Factor in dB.
PA = Preamplifier Factor in dB.

FA and PA are only be used for the measuring frequency above 1 GHz.
