APPENDIX A: RF EXPOSURE

From FCC 1.1310 Table 1B, the maximum permissible RF exposure for an uncontrolled environment is 1 mW/cm^2. The electric field generated for a 1 mW/cm^2 exposure (S) is calculated as follows:

$$S = (P \times G)/(4 \times \pi \times d^2)$$

where:
S = Power density
P = Transmitter conducted power in watts
G = Numeric gain
d = distance to radiation center

Fundamental Operating Frequency: 2463 MHz
Maximum Rated Output Power: 1.0 Watt (1000 mW)
Antenna Gain =5.5 dBi; Numeric Gain = 3.55

S = (1000 X 3.55)/ (4 x Pi X 20^2) = 0.71 mW/cm^2

Under normal operating conditions, the antenna is designed to maintain a separation distance of 20 cm from all persons. The EUT is mobile and fixed.

Calculated Power Density:

Antenna Gain = 5.5 dBi Conducted Power = 1000 mW	
Separation Distance = 20 cm	
FCC power density limit	Calculated Power density at 20 cm distance
1 mW/cm^2	0.71 mW/cm^2
