

Letter of Transmittal

References:

1. FCC Identifier NIR-10108

The change requested is a broadening of the line through addition of an additional series of lamps having different housings to accommodate specific applications. The circuit boards have different physical configurations to fit the housings but contain the same components arranged in the same ways. There are no changes in the frequency determining and stabilizing circuits. The operating frequency of 0.045 MHz remains the same. The components vary in the similar manner as those of the original grant and are shown in the schematics for the three wattages under consideration. The emissions of individual wattage lamps vary from those of the original submission and from each other, but all meet the requirements of the FCC Part 18 as shown in the test report. The fluorescent lamps are covered with various outer bulb shapes strictly for decorative purposes as shown in the external photo. Thus, this is classified as a Class II permissive change.
