The sample was tested according to the following specification:

FCC Parts 15.247; ANSI C-63.4-2003

## 3.2 Transmitter requirements

### 3.2.1 Carrier Frequency Separation

#### Procedure:

The carrier frequency separation was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function enabled.

After the trace being stable, the reading value between the peaks of the adjacent channels using the marker-delta function was recorded as the measurement results.

The spectrum analyzer is set to:

Span = 3 MHz (wide enough to capture the peaks of two adjacent channels)

RBW = 30 kHz (1% of the span or more)      Sweep = auto

VBW = 30 kHz      Detector function = peak

Trace = max hold

#### Measurement Data:

| Frequency of marker #1<br>(MHz) | Frequency of marker #2<br>(MHz) | Test Results                       |                 |
|---------------------------------|---------------------------------|------------------------------------|-----------------|
|                                 |                                 | Carrier Frequency Separation (MHz) | Result          |
| 2440.995                        | 2442.025                        | 0.995                              | <b>Complies</b> |

- See next pages for actual measured spectrum plots.

#### Minimum Standard:

The EUT shall have hopping channel carrier frequencies separated by a minimum of 25kHz or the 20dB bandwidth of the hopping channel, whichever is greater.

#### Measurement Setup

Figure 1: Measurement setup for the carrier frequency separation

## Carrier Frequency Separation

### 3.2.2 Number of Hopping Frequencies

#### Procedure:

The number of hopping frequencies was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function enabled.

To get higher resolution, four frequency ranges within the 2400 ~ 2483.5 MHz FH band were examined.

The spectrum analyzer is set to:

Frequency range 1: Start = 2389.5MHz, Stop = 2414.5 MHz

2: Start = 2414.5MHz, Stop = 2439.5 MHz

3: Start = 2439.5MHz, Stop = 2464.5 MHz

4: Start = 2464.5MHz, Stop = 2489.5 MHz

RBW = 300 kHz (1% of the span or more) Sweep = auto

VBW = 300 kHz (VBW  $\geq$  RBW) Detector function = peak

Trace = max hold Span = 25MHz

#### Measurement Data: **Complies**

|                                  |    |
|----------------------------------|----|
| Total number of Hopping Channels | 79 |
|----------------------------------|----|

- See next pages for actual measured spectrum plots.

#### Minimum Standard:

|                   |
|-------------------|
| At least 75 hopes |
|-------------------|

#### Measurement Setup

Same as the Chapter 3.2.1 (Figure 1)

# Number of Hopping Frequencies

# Number of Hopping Frequencies

### 3.2.3 20 dB Bandwidth

#### Procedure:

The bandwidth at 20 dB below the highest inband spectral density was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function disabled at the highest, middle and the lowest available channels..

After the trace being stable, Use the marker-to-peak function to set the marker to the peak of the emission. Use the marker-delta function to measure 20dB down one side of the emission. Reset the marker-delta function, and move the marker to the other side of the emission, until it is ( as close as possible to ) even with the reference marker level. The marker-delta reading at this point is the 20 dB bandwidth of the emission.

The spectrum analyzer is set to:

Center frequency = the highest, middle and the lowest channels

Span = 2 MHz (approximately 2 or 3 times of the 20 dB bandwidth)

RBW = 10 kHz (1% of the 20dB bandwidth or more) Sweep = auto

VBW = 30 kHz ( $VBW \geq RBW$ ) Detector function = peak

Trace = max hold

#### Measurement Data:

| Frequency<br>(MHz) | Channel No. | Test Results                |          |
|--------------------|-------------|-----------------------------|----------|
|                    |             | Measured Bandwidth<br>(MHz) | Result   |
| 2402               | 1           | 0.950                       | Complies |
| 2441               | 40          | 0.947                       | Complies |
| 2480               | 79          | 0.930                       | Complies |

- See next pages for actual measured spectrum plots.

#### Minimum Standard:

The transmitter shall have a maximum 20dB bandwidth of 1 MHz.

#### Measurement Setup

Same as the Chapter 3.2.1 (Figure 1)

# 20 dB Bandwidth

## 20 dB Bandwidth

### 3.2.4 Time of Occupancy (Dwell Time)

#### Procedure:

The dwell time was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function enabled.

The spectrum analyzer is set to:

Center frequency = 2441 MHz

Span = zero

RBW = 1 MHz

VBW = 1 MHz (VBW  $\geq$  RBW)

Trace = max hold

Detector function = peak

#### Measurement Data:

| Packet Type | Burst duration in one hop (us) | Test Results    |          |
|-------------|--------------------------------|-----------------|----------|
|             |                                | Dwell Time (ms) | Result   |
| DH 1        | 420                            | 134.446         | Complies |
| DH 3        | 1680                           | 270.749         | Complies |
| DH 5        | 2933                           | 312.335         | Complies |

- See next pages for actual measured spectrum plots.

#### Minimum Standard:

|   |
|---|
| 0.4 seconds within a 30 second period per any frequency |
|---|

#### Measurement Setup

Same as the Chapter 3.2.1 (Figure 1)

## Time of Occupancy for Packet Type DH 1

The system makes worst case 1600 hops per second or 1 time slot has a length of 625 us with 79 channels. A DH 1 Packet need 1 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case  $1600/2 = 800$  hops per second with 79 channels. So you have each channel  $800/79 = 10.13$  times per second and so for a period of  $0.4 \times 79 = 31.6$  seconds you have  $10.13 \times 31.6 = 320.11$  times of appearance.

Each Tx-time per appearance is 420 us

So we have  $320.11 \times 420\text{us} = 134.446 \text{ ms}$  per 31.6 seconds.

### Time of Occupancy for Packet Type DH 3

The system makes worst case 1600 hops per second or 1 time slot has a length of 625 us with 79 channels. A DH 3 Packet need 3 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case  $1600/4 = 400$  hops per second with 79 channels. So you have each channel  $400/79 = 5.1$  times per second and so for a period of  $0.4 \times 79 = 31.6$  seconds you have  $5.1 \times 31.6 = 161.16$  times of appearance.

Each Tx-time per appearance is 1.68 ms

So we have  $161.16 \times 1.68 \text{ ms} = 270.749 \text{ ms}$  per 31.6 seconds.

## Time of Occupancy for Packet Type DH 5

The system makes worst case 1600 hops per second or 1 time slot has a length of 625 us with 79 channels. A DH 5 Packet need 5 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case  $1600/6 = 266.67$  hops per second with 79 channels. So you have each channel  $266.67/79 = 3.37$  times per second and so for a period of  $0.4 \times 79 = 31.6$  seconds you have  $3.37 \times 31.6 = 106.49$  times of appearance.

Each Tx-time per appearance is 2.933 ms

So we have  $106.49 \times 2.933 \text{ ms} = 312.335 \text{ ms}$  per 31.6 seconds.

### 3.2.5 Peak Output Power

#### Procedure:

The peak output power was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function disabled at the highest, middle and the lowest available channels..

After the trace being stable, Use the marker-to-peak function to set the marker to the peak of the emission. The indicated level is the peak output power.

The spectrum analyzer is set to:

Center frequency = the highest, middle and the lowest channels

Span = 5 MHz (approximately 5 times of the 20 dB bandwidth)

RBW = 1 MHz (greater than the 20dB bandwidth of the emission being measured)

VBW = 1 MHz (VBW  $\geq$  RBW)

Detector function = peak

Trace = max hold

Sweep = auto

#### Measurement Data:

| Frequency<br>(MHz) | Ch. | Test Results |       |          |
|--------------------|-----|--------------|-------|----------|
|                    |     | dBm          | mW    | Result   |
| 2402               | 1   | 3.83         | 2.415 | Complies |
| 2441               | 40  | 3.76         | 2.377 | Complies |
| 2480               | 79  | 3.80         | 2.399 | Complies |

- See next pages for actual measured spectrum plots.

|                   |      |
|-------------------|------|
| Minimum Standard: | < 1W |
|-------------------|------|

#### Measurement Setup

Same as the Chapter 3.2.1 (Figure 1)

# Peak Output Power

## Peak Output Power

### 3.2.6 Conducted Spurious Emissions

#### Procedure:

The bandwidth at 20dB down from the highest inband spectral density is measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function disabled at the highest, middle and the lowest available channels.

After the trace being stable, Use the marker-to-peak function to measure 20 dB down both sides of the intentional emission.

The spectrum analyzer is set to:

Center frequency = the highest, middle and the lowest channels

RBW = 100 kHz

VBW = 100 kHz

Span = 100 MHz

Detector function = peak

Trace = max hold

Sweep = auto

#### Measurement Data: **Complies**

- All conducted emission in any 100kHz bandwidth outside of the spread spectrum band was at least 20dB lower than the highest inband spectral density. Therefore the applying equipment meets the requirement.
- See next pages for actual measured spectrum plots.

|                          |          |
|--------------------------|----------|
| <b>Minimum Standard:</b> | > 20 dBc |
|--------------------------|----------|

#### Measurement Setup

Same as the Chapter 3.2.1 (Figure 1)

### Low band with hopping disabled

### Low band with hopping enabled

# Low channel spurious

# Mid channel ref

# Mid channel spurious

### High band with hopping disabled

### High band with hopping enabled

# High channel spurious

### 3.2.7 Radiated Emissions

#### Procedure:

The EUT was placed on a 0.8m high wooden table inside a shielded enclosure. An antenna was placed near the EUT and measurements of frequencies and amplitudes of field strengths were recorded for reference during final measurements. For final radiated testing, measurements were performed in OATS. Measurements were performed with the EUT oriented in 3 orthogonal axis and rotated 360 degrees to determine worst-case orientation for maximum emissions.

The spectrum analyzer is set to:

Center frequency = the worst channel

Frequency Range = 30 MHz ~ 10<sup>th</sup> harmonic.

RBW = 120 kHz ( 30MHz ~ 1 GHz)

= 1 MHz (1 GHz ~ 10<sup>th</sup> harmonic )

Trace = max hold

VBW ≥ RBW ( Peak)

VBW = 10Hz (Average)

Sweep = auto

#### Measurement Data: **Complies**

- No emissions were detected at a level greater than 10dB below limit.
- Refer to the next page.

**Minimum Standard: FCC Part 15.205 (a), 15.205(b), 15.209(a) and (b)**

#### Limit : FCC P15.209(a)

| Frequency (MHz) | Limit (uV/m) @ 3m |
|-----------------|-------------------|
| 30 ~ 88         | 100 **            |
| 88 ~ 216        | 150 **            |
| 216 ~ 960       | 200 **            |
| Above 960       | 500               |

\*\* Except as provided in 15.209(g), fundamental emissions from intentional radiators operating under this Section shall not be located in the frequency bands 54-72 MHz, 76-88MHz, 174-216MHz or 470-806MHz. However, operation within these frequency bands is permitted under other sections of this Part, e.g. 15.231 and 15.241.

Not. 1. No other emissions were detected at a level greater than 10dB below limit.

2. T.F(Total Factor) = Cable Loss + Ant Factor –AMP Gain

3. Result = Reading Value + T.F

4. Margin = Limit - Result

### 3.2.8 AC Line Conducted Emissions

#### Procedure:

The conducted emissions are measured in the shielded room with a spectrum analyzer in peak hold. While the measurement, EUT had its hopping function disabled at the middle channels in line with Section 15.31(m). Emissions closest to the limit are measured in the quasi-peak mode (QP) with the tuned receiver using a bandwidth of 9 kHz. The emissions are maximized further by cable manipulation and Exerciser operation. The highest emissions relative to the limit are listed.

#### Measurement Data: **Complies**

- Refer to the next page.

#### Minimum Standard: FCC Part 15.207(a)/EN 55022

| Frequency Range<br>(MHz) | Conducted Limit (dBuV) |            |
|--------------------------|------------------------|------------|
|                          | Quasi-Peak             | Average    |
| 0.15 ~ 0.5               | 66 to 56 *             | 56 to 46 * |
| 0.5 ~ 5                  | 56                     | 46         |
| 5 ~ 30                   | 60                     | 50         |

\* Decreases with the logarithm of the frequency

#### Measurement Setup
