## Chapter I GENERAL

### 1.1 Introduction :

The following measurement report is submitted on behalf of **YEUN TAH INDUSTRIAL CO., LTD.** in support of a wireless microphone certification in accordance with FCC Rules. 2.981 through 2.999 and 74.861.

### Description of EUT :

### 1.2 Description of Support Equipment :

N/A

### 1.3 Configuration of test setup

### 1.4 Location of the Measurement Site :

The radiated emissions measurements required by the Rules were performed on the Three-meter, anechoic chamber at test site maintained by **Training Research Co., Ltd.**, 2, Lane 194, Huan-Ho Street, Hsichih, Taipei Hsien 221, Taiwan. Complete description and measurement data have been placed on file with the Commission. The conducted power line Emissions tests were performed in a shielded enclosure also located at the above facility.

**Training Research Co., Ltd.** is listed by the FCC (Registration Number: 93906) as a facility available to do measurement work for others on a contract basis.

### 1.5 General Test Condition :

The conditions under which the EUT operates were varied to determine their effect on the equipment's emission characteristics. The final configuration of the test system and the mode of operation used during these tests was chosen as that which produced the highest emission levels. However, only those conditions, which the EUT was considered likely to encounter in normal use were investigated.

## Chapter 2 Power Output Measurement

### 2.1 Rules and Specification Limits

2.985

74.861 ( e )( 1 ) : The power of the measured unmodulated carrier power at output of the transmitter power amplifier ( antenna input power ) may not exceed the following:

1. 54 – 72, 76 – 88 and 174 – 216 MHz band 50 mW.
2. 470 – 608 AND 614 – 806 MHz band 250 mW.

### 2.2 Test condition and setup :

1. Measurement was made on open-field test site. The EUT system was placed on non-conductive turntable which is 0.8 meters height, top surface 1.0 X 1.5 meter. The EUT was placed in three direction of the space in order to obtain maximum emission.
2. A SCHAFFNER whole range antenna with horizontal and vertical polarization was raised from 1 – 4 meter as well as the turntable was rotate from 0 to 360 degree to search for the maximum Field Strength Spectrum where the spectrum analyzer was operated in the quasi-peak detection mode. Recorded all the values, which measured under horizontal and vertical position for the biconical antenna.
3. The following procedures were used to convert the emission levels measured in decibels referenced to 1 microvolt (dB $\mu$ V) into field intensity in Watt.
  - (1) The actual field intensity in decibels referenced to 1 micro volt per meter (dB $\mu$ V/m) is determined by algebraically adding the measured reading in dB $\mu$ V, the antenna factor (dB), and cable loss (dB) at the appropriate frequency.
  - (2) The field intensity in Volt can then be determined by the following equation:  

$$FI(Volt) = 10^{\frac{FI(dB\mu V/m)}{20}} \times 10^{-6}$$

$$FI_a(dBmV/m) = FI_r(dBmV) - \text{Corrected (dB)}$$

$$\text{Corrected (dB)} = AF(dB) + [CL(dB) - \text{Amplitude Gain}]$$

FI<sub>a</sub> : Actual Field Intensity

FI<sub>r</sub> : Reading of the Field Intensity

AF : Antenna Factor

CL : Cable Loss

The field intensity in Watt can then be determined by the following equation :

$$P \text{ (watt)} = F I^2 \text{ ( Volt )} \times d^2 \text{ (meter)} / 49.2$$

P : Power in Watt

D : Measurement Distance ( 3 m )

**74.861( e )( b )(iii) :** Spurious and harmonics must be at least  $43 + 10 \log$  (Output Power ) below the Carrier peak

**2.997 :** In all measurements set forth , the spectrum should be investigated from the lowest radio frequency generated in the equipment up to at least the 10<sup>th</sup> harmonic of the carrier frequency.

### 5.2 Measurement Condition & Setup

**Pretest :** The EUT is placed in a anechoic chamber, and scan from 30MHz to 1GHz.This is done to ensure the radiation exactly emits form the EUT.

**Final test :** Final radiation measurements is made on a **3 - meter, anechoic chamber.** The EUT is placed on a nonconductive table, which is 0.8m height, the top surface is 1.0 x 1.5 meter. All the placement is according to ANSI C63.4 - 1992.

The spectrum is examined from 30 MHz to 18 GHz measured by HP spectrum.

The SCHAFFNER and EMCO whole range Antenna is used to measure frequency from 30 MHz to 18 GHz. The final test is used the spectrum HP 8546A, HP 85460A and 8564E.

Measure more than six top marked frequencies generated form pretest by computer step by step at each frequency. The EUT is rotated 360 degrees, and antenna is raised and lowered from 1 to 4 meter to find the maximum emission levels. The antenna is used with both horizontal and vertical polarization.

Appropriated preamplifier which is made by TRC is used for improving sensitivity and precautions is taken to avoid overloading .The spectrum analyzer's 6dB bandwidth is set to 120 K Hz , and the EUT is measured at quasi-peak mode.

If the emission is close to the frequency band of ambient, the tester will recheck the data and the corrected data will be written in the test data sheet. If the emission is just within the ambient, the data from anechoic will be taken as the final data.

The actual field intensity in decibels referenced to 1 microvolt per meter (dB $\mu$ V/m) is determined by algebraically adding the measured reading in dB $\mu$ V, the antenna factor (dB) and cable loss (dB) at the appropriate frequency.

Note:

1. Margin = Amplitude - limit, *if margin is minus means under limit.*
2. Corrected Amplitude = Reading Amplitude – Correction Factors
3. Correction factor = Antenna factor + ( Cable Loss – Amplitude gain )  
( For example : 30MHz correction factor = 15.5 – (–15.26) = 30.76 dB/m )
4. Attenuation required =  $43 + 10 \log ( 0.10775 \text{ mW} ) = 3.32$

$$\text{Limit} = 87.70 - 3.32 = 84.38$$

## Chapter 6 Frequency Stability Tolerance Measurement

### 6.1 Rules and Specification Limits

2.995

74.861(e)(4): The frequency tolerance of the transmitter shall be 0.005 percent.

### 6.2 Measurement Condition & Setup with Temperature Variation

1. Place the EUT in the chamber, powered in its normal operation.
2. Set the temperature of the chamber -30 degree Centigrade. Allow the equipment to stabilize at that temperature.
3. Measured the carrier frequency using preamplifier and frequency counter.
4. Repeated procedures 1 to 3 from -20 to 50 degree Centigrade at intervals of 10 degree.
