1.2 Test Methodology

Purpose of Test: To demonstrate compliance with the ANSI C63.4 setup.

Test Performed: X 1. Conducted Emissions, FCC Part 2, Paragraph 2.1046, 2.1047(a), 2.1049, 2.1051, and Part 87, Paragraphs 87.131, 87.135, 87.141
2. Radiated Emissions EN55022: 1992 Class B limit, 30 - 1,000 MHz, 10 meters
X 3. Radiated Emission per FCC Part 2, Paragraph 2.1053, Part 87, Paragraph 87.139
X 4. Frequency Stability Part 2, Paragraph 2.1046 Part 87, Paragraph 87.131

Both Conducted and radiated testing were performed according to the procedures in FCC/ANSI C63.4 and CSA 108.8 - M1983. Radiated testing was performed at an antenna-to-EUT distance of 3 meters (1 - 10 GHz).

1.3 Test Facility

The open area test site and conducted measurement data were tested by:

TÜV PRODUCT SERVICE
10040 Mesa Rim Road
San Diego, CA 92121-2912
Phone: 619 546 3999
Fax: 619 546 0364

The Test Site Data and performance comply with ANSI 63.4 and are registered with the FCC, 7435 Oakland Mills Rd, Columbia Maryland 21046. All Measurement Data is acquired according to the content of FCC Measurement Procedure and ANSI C63.4, unless supplemented with additional requirements as noted in the test report.

1.4 Part 2 Requirements

See attachments.

- A) **Microprocessor Nos. Control: i386**
Digital Signal Processor TMS320C31
- B) **Type of emission.**
A3E, manual page 1-3 (AM, mode O)
- C) **Frequency Range. Manual page 1-2**
118-136.975 MHz
- D) **Range of Operating Power values** or specific operating **power levels**;
and **description** of any means provided for **variation of operating power**.
1 - 25 Watts in 1 W increments, Manual page 1-3.
Page 3-1 Remote control via RS-232.
- E) **Maximum power rating**
25 Watts, Manual page 1-3; Frequency Tolerance, 2% 273 Hz, 20 ppm Manual 1-2.
- F) **DC voltages** applied to and **dc currents** into the several elements of the final radio
frequency amplifying device for normal operation over the power range.
24 - 32 Vdc @ 15 amps, manual page 1-3
- G) **Description of the modulation system** to be used, including the response characteristics
(frequency, phase and amplitude) of any filters provided
See manual, page 4-1.
- H) **Description of the modulating wavetrain**
AM. It is produced in Digital Signal Processor but the output is amplitude modulation.
- I) **The unit is not stereo.**

2. SYSTEM TEST CONFIGURATION

2.1 Justification

The **Transceiver, Model ATC-100** was initially tested for FCC emission in the following configuration:

See Block Diagram attached.

2.2 EUT Exercise Software

None

2.3 Special Accessories

None

2.4 Modification

None

2.5 Configuration of Tested System

See Block Diagram attached.

3 TEST REPORT

3.1 Emissions Test Conditions: RADIATED EMISSIONS, FCC Part 2, Paragraph 2.1053, Part 87, Paragraph 87.139

The *RADIATED EMISSIONS* measurements were performed at the following test location :

☐ - Test not applicable

■ - Roof (Small Open Area Test Site)

Testing was performed at a test distance of:

■- 3 meters

Test Equipment Used :

Model No.	Prop. No.	Description	Manufacturer	Serial No.	Cal Date
3115	453	Antenna, Double Ridge Guide	EMCO	9412-4363	10/99
3104	234	Biconical Antenna	EMCO	3031	08/99
3146	244	Log Periodic Antenna	EMCO	1063	09/99
8566B	720	Spectrum Analyzer	Hewlett Packard	211500842	03/99
8566B	721	Spectrum Analyzer Display	Hewlett Packard	2112A02185	03/99

Remarks: See test setup photos for test setup.

Field Strength Calculation

If a preamplifier was used during the Radiated Emission Testing, it is required that the amplifier gain must be subtracted from the Spectrum Analyzer (Meter) Reading. In addition, a correction factor for the antenna, cable used and a distance factor, if any, must be applied to the Meter Reading before a true field strength reading can be obtained. In the automatic measurement, these considerations are automatically presented as a part of the print out. In the case of manual measurements and for greater efficiency and convenience, instead of using these correlation factors for each meter reading, the specification limit was modified to reflect these correlation factors at each frequency value so that the meter readings can be compared directly to the modified specification limit. This modified specification limit is referred to as the "Corrected Meter Reading Limit" or simply the CMRL, which is the actual field strength present at the antenna. The quantity can be derived in the following manner:

$$\text{Corrected Meter Reading Limit (CMRL)} = \text{SAR} + \text{AF} + \text{CL} - \text{AG} - \text{DC}$$

Where, SAR = Spectrum Analyzer Reading

AF = Antenna Factor

CL = Cable Loss

AG = Amplifier Gain (if any)

DC = Distance Correction (if any)

Assume the following situation: A meter reading of 29.4 dBuV was obtained from a Class A computing device measured at 83 MHz. Assume an antenna factor of 9.2 dB, a cable loss of 1.4 dB and amplifier gain of 20.0 dB at 83 MHz. The final field strength would be determined as follows:

$$\text{CMRL} = 29.4 \text{ dBuV} + 9.2 \text{ dB} - 1.4 \text{ dB} - 20 \text{ dB/M} - 0.0 \text{ dB}$$

$$\text{CMRL} = 20.0 \text{ dBuV/M}$$

This result is well below the FCC and CSA Class A limit of 29.5 dbuV/m at 83 MHz.

For the manual mode of measurement, a table of corrected meter reading limit was used to permit immediate comparison of the meter reading to determine if the measure emission amplitude exceeded the specification limit at that specific frequency.

Frequency Stability

fcctemp.atc

Test Procedure for Temperature Stability Test

Mon 4-19-99

A. Description: The requirements are that the "frequency determining unit" be checked from -20°C to +50°C. The unit must "soak" for one hour before the measurement is taken. This means that the test will be 8 hours.

The frequency measurement is taken from the output of the ATC-100 with a frequency counter (HP5386A) through an appropriate amount of attenuation.

The resolution of the frequency counter will be 10 Hz.

B. Procedure:

(Step #)

1. Begin: Put the warmed-up ATC-100, tuned to 136.975 MHz, into the temperature chamber. Make a baseline frequency measurement at ambient temperature (+22°C).
2. Time 0: Turn on the temp chamber and set it to -20 C. Wait 1 hour.
3. Time 1: Turn on the ATC-100. Set the frequency to 136.975 MHz.
Key the ATC-100 and make a frequency measurement every minute for 10 minutes.
Turn off the ATC-100. Set the temperature chamber to -10 C. Wait one hour.
4. Time 2: Turn on the ATC-100. Set the frequency to 136.975 MHz.
Key the ATC-100 and make a frequency measurement every minute for 10 minutes.
Turn off the ATC-100. Set the temperature chamber to 0 C. Wait one hour.
5. Time 3: Turn on the ATC-100. Set the frequency to 136.975 MHz.
Key the ATC-100 and make a frequency measurement every minute for 10 minutes.
Turn off the ATC-100. Set the temperature chamber to +10 C. Wait one hour.
6. Time 4: Turn on the ATC-100. Set the frequency to 136.975 MHz.
Key the ATC-100 and make a frequency measurement every minute for 10 minutes.
Turn off the ATC-100. Set the temperature chamber to +20 C. Wait one hour.
7. Time 5: Turn on the ATC-100. Set the frequency to 136.975 MHz.
Key the ATC-100 and make a frequency measurement every minute for 10 minutes.
Turn off the ATC-100. Set the temperature chamber to +30 C. Wait one hour.
8. Time 6: Turn on the ATC-100. Set the frequency to 136.975 MHz.
Key the ATC-100 and make a frequency measurement every minute for 10 minutes.
Turn off the ATC-100. Set the temperature chamber to +40 C. Wait one hour.
9. Time 7: Turn on the ATC-100. Set the frequency to 136.975 MHz.
Key the ATC-100 and make a frequency measurement every minute for 10 minutes.
Turn off the ATC-100. Set the temperature chamber to +50 C. Wait one hour.
10. Time 9: Turn on the ATC-100. Set the frequency to 136.975 MHz.
Key the ATC-100 and make a frequency measurement every minute for 10 minutes.
Turn off the ATC-100. Set the temperature chamber to +22 C. Wait one hour.
11. Time 10: Turn on the ATC-100. Set the frequency to 136.975 MHz.
Key the ATC-100 and make a frequency measurement every minute for 10 minutes.

TEST DATA SHEET TEMPERATURE STABILITY TEST

ATC-100

4-20-99

4-28-99

Verify that the output frequency of the ATC-100 remains ± 20 PPM from -20°C to $+50^{\circ}\text{C}$.
(At 136.975 MHz 20 PPM = 2.739 kHz)

Temp ($^{\circ}\text{C}$)	Frequency (Hz)		Temp ($^{\circ}\text{C}$)	Frequency (Hz)	
Step 1 $+22^{\circ}\text{C}$	136,975,340		Step 3 -20°C	136,975,140	
	250	1 min		120	1 min
	260	2 min		110	2 min
	250	3 min		090	3 min
	240	4 min		080	4 min
	240	5 min		070	5 min
	230	6 min		050	6 min
	230	7 min		040	7 min
	220	8 min		030	8 min
	220	9 min		030	9 min
	210	10 min		030	10 min
Step 4 -10°C	136,975,110		Step 5 0°C	030	
	100	1 min		020	1 min
	080	2 min		020	2 min
	060	3 min		020	3 min
	050	4 min		020	4 min
	040	5 min		030	5 min
	030	6 min		040	6 min
	030	7 min		050	7 min
	020	8 min		060	8 min
	020	9 min		070	9 min
	020	10 min		080	10 min
Step 6 $+10^{\circ}\text{C}$	136,975,070		Step 7 $+20^{\circ}\text{C}$	260	
	070	1 min		240	1 min
	080	2 min		230	2 min
	100	3 min		220	3 min
	110	4 min		220	4 min
	130	5 min		220	5 min
	150	6 min		230	6 min
	170	7 min		240	7 min
	200	8 min		250	8 min
	230	9 min		260	9 min
	250	10 min		260	10 min

Step 8 +30°C 136,975,240

<u>250</u>	1 min
<u>270</u>	2 min
<u>290</u>	3 min
<u>300</u>	4 min
<u>300</u>	5 min
<u>300</u>	6 min
<u>300</u>	7 min
<u>300</u>	8 min
<u>300</u>	9 min
<u>310</u>	10 min

Step 9 +40°C 136,975,390

<u>400</u>	1 min
<u>420</u>	2 min
<u>440</u>	3 min
<u>470</u>	4 min
<u>490</u>	5 min
<u>520</u>	6 min
<u>540</u>	7 min
<u>550</u>	8 min
<u>560</u>	9 min
<u>570</u>	10 min

Step 10 +50°C 136,975,650

<u>640</u>	1 min
<u>630</u>	2 min
<u>610</u>	3 min
<u>600</u>	4 min
<u>600</u>	5 min
<u>600</u>	6 min
<u>590</u>	7 min
<u>590</u>	8 min
<u>590</u>	9 min
<u>580</u>	10 min

Step 11 +22°C 136,975,220

<u>230</u>	1 min
<u>240</u>	2 min
<u>260</u>	3 min
<u>280</u>	4 min
<u>290</u>	5 min
<u>320</u>	6 min
<u>310</u>	7 min
<u>300</u>	8 min
<u>290</u>	9 min
<u>280</u>	10 min
