EXPOSITORY STATEMENT

Laser Tag

Each Stunner laser tag vest is equipped with infrared sensors and emitters. When the player fires the laser tag gun a coded infrared pulse is sent out the barrel of the gun which can "tag" another player's sensors. When a player is tagged their vest sends (via the radio transceiver) a coded message to the game control computer that identifies who just tagged them. The game computer then notifies (via the radio transceiver) the shooter that they have tagged someone.
