Hello Sir,

Below are some Technical issues that Greg Czumak found upon review. Please respond, and after the 15.19 and 15.21 statement issues are addressed, along with these, the application will be complete. Any questions, please do not hesitate to contact me.

1. Please justify the fast (coupled) sweep time used to measure the power spectral density of the EUT in its hybrid mode, as this sweep time exceeds the slow sweep specified by the test procedure. While you have answered this same question several times in the past, this same response must appear in every new application, as each application must be judged on its own merits, and must stand alone.
2. FYI- in the future, please be sure to maintain the 10cm spacing requirement between devices on the test stand, as is required by ANSI C63.4.
