

Description of Product as Marketed:

This product provides a convenient and simple means of creating an awareness of the light situation, and presumably the occupancy, in a room such a bathroom, from other locations in the same building. It includes two modules: 1) a light activated transmitter module for a key location to be monitored and 2) a light emitting receiver module for other locations. The transmitter module is activated only by incandescent light, not fluorescent. The transmitter module can tolerate a low level of ambient light without being activated. The modules are powered by wall transformers.

This system is particularly useful in homes and guesthouses where bathroom facilities are shared. There are many other situations where it is also very useful.

Equipment will be operated under FCC Rule Part(s): FCC Rule Part 15.231
