

Equipment Authorization measurements on 902-928 MHz Transceiver Unit, Modular device FCC ID: OG4-TRXBQ900 (10 appendices)

Rev.1, 2012-12-11: Added appendix 2 (was implemented in Appendix 3 before) and Appendix 6 (measurements has been performed and added).

Appendix 9: Corrected output power to EIRP instead of ERP and calculated by the formula $P = (Exd)2/30 \times G$.

Test objects

Product name: TRXBQ900

Art. no: 943058-000

Serial number: No serial numbers

The test object was powered with 3.5 V DC (nominal)

Eight different samples were used during the test:

- one for sample for each tested frequency
- different samples for the RP-SMA antennas and for the samples with the wire antenna

Summary

See Appendix 1 for general information and Appendix 10 for photos.

Emission measurements as specified below have been performed.

Standard	Compliant	Appendix	Remarks
FCC 47 CFR Part 15 C (07-10-08)			
15.249 Operation within the band 902-928 MHz	Yes		
IC RSS-210 Issue 8, December 2010	Yes		
Duty cycle measurements	N/A	2	
15.249 (a) / RSS-210 A2.9(a) Field strength of fundamental	Yes	3

Electronics - EMC

Performed by

Fredrik Isaksson

Examined by

Bengt Andersson

Performance test and requirements

The tests were performed to verify that TRXBQ900 meets the electromagnetic compatibility requirements of FCC 47 CFR part 15 C.

Test facility

The used anechoic chamber is compliant with the requirements of section 2.948 of the FCC rules and listed, registration number 96866, as a facility accepted for certification under parts 15 and 18. The site complies with RSS Gen and is accepted by Industry Canada for the performance of radiated measurements, IC-file number 3482A-2.

Test object

Transceiver:	TRXBQ900
Antenna connector	MMCX
Antenna 1:	Ex-it GSM/868, RP-SMA straight angle
Antenna 2:	Ex-it GSM/868, RP-SMA right angle
Antenna 3:	Wire antenna 40 mm, AWG23, 0.6 mm diameter
Nominal power setting:	41D792
Antenna 1 gain:	Max 3.0 dBi
Antenna 2 gain:	Max 3.0 dBi
Antenna 3 gain:	Not declared
Frequency range:	902.0875-927.9125 MHz
Frequencies used during test:	902.0875 MHz 915.0 MHz 927.9125 MHz
Modulation:	GFSK
Data rate:	9.6 kbps
Supply voltage:	3.5V DC, nominal

During the test the EUT was powered by a external DC power supply, Topward 6303DS SP 502 754, 3.5 V DC except for the conducted emission test on the AC mains where the HP E3632A SP 503 170 was used.

Operational test mode

Justification measurements were performed with rotation of the EUT through three orthogonal axes determine which orientation the radio module had the highest emission levels, see photos in Appendix 8.

The EUT was tested stand alone, as a modular device.

The test was performed with continuously transmission (100% duty cycle), if not otherwise stated, and with normal modulation.

For duty cycle measurements see appendix 2.

With the normal duty cycle the duty cycle was measured to $28.06/100.2 \text{ ms} = 0.121 = 28.0\%$.

The PRF was calculated to $PRF = 1/T = 1/100.2 \text{ ms} = 10 \text{ Hz}$, thus QP-detector was used without any correction for pulse desensitization.

Cabling during emission test:

EUT port	Cable type	Termination / use
DC power port	2-wire, unshielded, 3.0 m length	Connected to the DC power supply

Uncertainties

Measurement and test instrument uncertainties are described in the quality assurance documentation "SP QD 10885". The measurement uncertainties can be found in the table below. The uncertainties are calculated with a coverage factor $k=2$ (95% level of confidence).

The measurement uncertainties can be found in the table below:

Method	Uncertainty
Radiated emission, 30 – 1000 MHz	4.8/5.6 dB (V/H-pol)
Radiated emission, 1 – 40 GHz	2.6 dB

Compliance evaluation is based on a shared risk principle with respect to the measurement uncertainty.

Reservation

The test results in this report apply only to the particular test object as declared in the report.

Delivery of test object

The test object was delivered: 2012-03-12 and 2012-12-03

Test participants

Björn Quickers and Jan Forsgren, Åkerström Björbo AB (partly present)

Test engineers

Fredrik Isaksson, Azhar Abbas and Mattias Engström (2012-12-05), SP

Duty cycle measurements

Date 2012-03-12	Temperature 22 °C ± 3 °C	Humidity 30 % ± 5 %
--------------------	-----------------------------	------------------------

Test set-up and procedure

The measurements were performed according to ANSI C63.10-2009.

The test was performed with normal duty cycle and with normal modulation.

The radiated measurements were performed in a semi anechoic chamber. The measurements were performed with the EUT-axes, antenna at the position and polarization and the turntable with the highest level of the fundamental. The antenna distance was 3.0 m.

Test set-up photos during the tests can be found in Appendix 10.

2012-03-13	22 °C ± 3 °C	28 % ± 5 %
2012-03-14	22 °C ± 3 °C	28 % ± 5 %

Test set-up and procedure

The measurements were performed according to ANSI C63.10-2009.

The test was performed with the power setting: 41D792 (nominal) and with continuous transmission (100% duty cycle) and with normal modulation.

The radiated maximum peak radiated output power measurements were performed in the semi-anechoic chamber.

The fundamental was scanned with peak-detector with the antenna height 1-4 m and the turntable was varied between 0-360 degrees for maximum response. The antenna distance during the measurements was 3.0 m.

Final measurement was performed with detector according to the FCC rules.

Test set-up photos during the tests can be found in Appendix 10.

T_{nom} 22°C	V_{max} 5.5 V DC Note 1	82.1 dB μ V/m	77.4 dB μ V/m	76.7 dB μ V/m

Note 1: According 47CFR 15.31(e), for intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. For battery operated equipment, the equipment tests shall be performed using a new battery.

Limits

According to 47CFR 15.249(a), the field strength of emissions from intentional radiators operated within these frequency bands shall comply with the following:

According to RSS-210 A2.9(a), the field strength measured at 3 meter shall not exceed the following:

Fundamental Frequency	Field strength of fundamental	Field strength of harmonics
902-928 MHz	50 mV/m = 94 dB μ V/m	500 μ V/m = 54 dB μ V/m

Complies?	Yes
-----------	-----

Radiated emission measurements according to FCC 47 CFR part 15.249 (d) (e) / RSS 210-210 A2.9(b)

Date	Temperature	Humidity
2012-03-12	22 °C ± 3 °C	30 % ± 5 %
2012-03-13	22 °C ± 3 °C	28 % ± 5 %
2012-03-14	22 °C ± 3 °C	28 % ± 5 %

Test set-up and procedure

The measurements were performed according to ANSI C63.10-2009.

The test was performed with continuous transmission (100% duty cycle) and with normal modulation.

Two different power settings were used during the test, 41D792 (nominal) and 429692 (nominal+3 dB), see the results.

The test of radiated emission was performed in a semi anechoic chamber. The measurements were performed with both horizontal and vertical polarizations of the antenna. The antenna distance was 3.0 m.

The measurement procedure is as follows:

1. A pre-measurement is performed with peak detector. The test object is measured in eight directions with the antenna at three heights, 1.0 m, 1.5 m and 2.0 m (above 1 GHz pre-measurement was only performed at 1.0 m due to the small EUT size).
2. If the emission is close or above the limit during the pre-measurement, the test object is scanned 360 degrees and the antenna height scanned from 1 to 4 m for maximum response. Then the emission is measured with the quasi-peak detector on frequencies below 1 GHz and with the average detector above 1 GHz.

The measurement was first performed with peak detector.

The following RBW were used:

30 MHz-1 GHz: RBW=120 kHz

1-10 GHz: RBW=1 MHz

Test set-up photos during the tests can be found in Appendix 10.

45.9288	22.1	N/A	N/A	14.5	40	2.46	316	Vertical

Limits

According to 47CFR 15.249(a), the field strength of emissions from intentional radiators operated within these frequency bands shall comply with the following:

Fundamental Frequency	Field strength of harmonics
902-928 MHz	500 μ V/m = 54 dB μ V/m

According to 47CFR 15.249(d), emission radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in section 15.209, whichever is the lesser attenuation.

According to 47CFR 15.249(e), the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation.

According to RSS-210 A2.9(b), emissions radiated the outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to table 2 limits, whichever is the less stringent.

Complies?	Yes

20 dB bandwidth measurements according to FCC 47 CFR part 15.215 (c)

Date 2012-03-14	Temperature 22 °C ± 3 °C	Humidity 28 % ± 5 %
--------------------	-----------------------------	------------------------

Test set-up and procedure

The measurements were performed according to ANSI C63.10-2009.

The test was performed with the power setting: 41D792 (nominal) and with continuous transmission with normal duty cycle (28%) and with normal modulation.
The test was performed conducted at the antenna connector.

Measurement equipment	SP number
Test site, Edison	504 114

Multimeter Fluke 85 III	503 418
Temperature and humidity meter Testo 625	504 117

Measurement uncertainty: 2.6 %

Results

The 20 dB BW measurements can be found in the diagrams below:

Diagram 1	902.0875 MHz	20 dB BW = 11.62 kHz
Diagram 2	915.0 MHz	20 dB BW = 11.52 kHz
Diagram 3	927.9125 MHz	20 dB BW = 11.22 kHz

Limits

According to 47CFR 15.215(c), intentional radiators operating under the alternative provisions to the general emission limits, as contained in §§ 15.217 through 15.257 and in Subpart E of this part, must be designed to ensure that the 20 dB bandwidth of the emission, or whatever bandwidth may otherwise be specified in the specific rule section under which the equipment operates, is contained within the frequency band designated in the rule section under which the equipment is operated. The requirement to contain the designated bandwidth of the emission within the specified frequency band includes the effects from frequency sweeping, frequency hopping and other modulation techniques that may be employed as well as the frequency stability of the transmitter over expected variations in temperature and supply voltage. If a frequency stability is not specified in the regulations, it is recommended that the fundamental emission be kept within at least the central 80% of the permitted band in order to minimize the possibility of out-of-band operation.

Band edge measurements according to 47CFR 2.1049 / RSS-210 A2.9(b)

Date 2012-03-14	Temperature 22 °C ± 3 °C	Humidity 28 % ± 5 %
--------------------	-----------------------------	------------------------

Test set-up and procedure

The measurements were performed according to ANSI C63.10-2009.

The test was performed with the configuration with the highest fundamental power, with the RP-SMA straight antenna.

The test was performed with the power setting: 41D792 (nominal) and with continuous transmission with normal duty cycle (28%) and with normal modulation.

The radiated maximum peak radiated output power measurements were performed in the semi-anechoic chamber.

The measurement was scanned with peak detector with the antenna height 1-4 m and the turntable was varied between 0-360 degrees for maximum response, see Appendix 2. The antenna distance during the measurements was 3.0 m.

Test set-up photos during the tests can be found in Appendix 10, picture 2.

Measurement equipment	SP number

Results

Operation band 902-928 MHz

The pre-measurement diagrams with peak detector can be found in the diagrams below

	<u>f of EUT</u>	<u>Band edge at 902 MHz</u>
	902.0875 MHz	QP level at 902 MHz =42.7 dBμV/m Marker-delta method, step 1: QP level at fundamental = 88.8 dB μ V/m (according to Appendix 2)
Diagram 1	902.0875 MHz	Marker-delta method. Step 2: Delta between fundamental and 902 MHz = 46.1 dB. Step 3: Decrease the measured peak level in step 1: 88.8-46.1 = 42.7 dB μ V/m=level at band edge (limit=46.0 dB μ V/m) QP level at 901.76 MHz =45.6 dBμV/m (2x standard RBW (120 kHz) from band edge)
		<u>Band edge at 928 MHz</u>
	927.9125 MHz	QP level at 928 MHz =44.3 dBμV/m Marker-delta method, step 1: QP level at fundamental = 91.8 dB μ V/m (according to Appendix 2)
Diagram 2	927.9125 MHz	Marker-delta method. Step 2: Delta between fundamental and 928 MHz = 47.5 dB. Step 3: Decrease the measured peak level in step 1: 91.8-47.5 = 44.3 dB μ V/m=level at band edge (limit=46.0 dB μ V/m) QP level at 928.24 MHz =43.6 dBμV/m (2x standard RBW (120 kHz) from band edge)

Limits

According to 47CFR 15.249(d), emission radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in section 15.209, whichever is the lesser attenuation.

According to RSS-210 A2.9(b), emissions radiated the outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general field strength limits listed in RSS-Gen, whichever is the less stringent.

RF exposure evaluation: Mobile equipment / RSS-102 2.5.1

Date 2012-03-14	Temperature 22 °C ± 3 °C	Humidity 28 % ± 5 %
--------------------	-----------------------------	------------------------

Procedure

Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy levels in excess limit for maximum permissible exposure. In accordance with 47 CFR FCC Part 2 Subpart J, section 2.1091 this device has been defined as a mobile device whereby a distance of 0.2 m normally can be maintained between the user and the device.

Results

The following formula was used to calculate the RF exposure,

$$P_d = P_{out} \times G / (4 \times \pi \times r^2_{cm})$$

where,

P_d = power density in mW/cm²

P_{out} = output power to antenna in mW

G = gain of antenna in linear scale

π = 3.1416

r = distance between observation and center of the radiator in cm

From the peak EUT RF output power, the minimum mobile separation distance, $r=20$ cm, as well as the gain of the used antenna, the RF power density can be obtained.

The maximum radiated peak output power from Appendix 3 was used for calculation of MPE.

Antenna Gain (dBi)	Antenna Gain (numeric)	EIRP Peak output power (dBm)	Peak output power (mW)	Power density, P_d [S] (mW/cm ²)	Limit of power density (mW/cm ²)
Note 1	Note 1	-3.4 Note 2	0.457	0.00009	0.62

Note 1: The antenna gain is not used in the MPE calculation as the EIRP value (including the antenna) is used.

Note 2: The measurements were performed in field strength in dB μ V/m. The EIRP level was then calculated by the formula $P = (E_{fd})^2 / 30 \times G$, with G as unity gain of 1.

Limits

(A) Limits for Occupational/Controlled Exposure

Frequency range (MHz)	Electric field strength [E] (V/m)	Magnetic field strength [H] (A/m)	Power density [S] (mW/cm ²)	Averaging time E ² , H ² or S (minutes)
0.3-3.0	614	1.63	(100)*	6
3.0-30	1842/f	4.89/f	(900/f)*	6
30-300	61.4	0.163	1.0	6
300-1500			F/300	6
1500-100,000			5	6

(B) Limits for General Population/Uncontrolled Exposure

Frequency range (MHz)	Electric field strength [E] (V/m)	Magnetic field strength [H] (A/m)	Power density [S] (mW/cm ²)	Averaging time E ² , H ² or S (minutes)
0.3-1.34	614	1.63	(100)*	30
1.34-30	824/f	2.19/f	(180/f)*	30
30-300	27.5	0.073	0.2	30
300-1500			F/1500	30
1500-100,000			1.0	30

Note: f=frequency in MHz, *Plane-wave equivalent power density

According to RSS-102 2.5.1, SAR evaluation is required if the separation distance between the user and the radiating element of the device is less than or equal to 20 cm, except when the device operates as follows:

- From 3 kHz up to 1 GHz inclusively, and with output power (i.e. the higher of the conducted or equivalent isotropically radiated power (e.i.r.p) source-base, time-averaged output power) that is less than or equal to 200 mW for general use and 1000 mW for controlled use.

Complies?	Yes
