Re: FCC Radio Certification of Glucose Sensor Transmitter GST3; MMT-7763A

Date: 16FEB15

CKC Test Report No.: 93243-15 (15.109) and 95059-8 (15.247) for GST3 Glucose Sensor Transmitter, Model: MMT-7763A was tested to standards FCC Part 15 Subpart C, sections 15.109 and 15.247 and issued 31OCT13. Documentation supporting FCC regulatory radio approval was submitted to CKC CS shortly thereafter accompanied by a request of an indefinite deferral date. The reason for this deferral was a business decision to postpone RF certification until the Glucose Sensor Transmitter Model 7763A device was closer to product launch. GST3 is a component of the 600 series insulin pump systems that sends blood glucose data information via RF to a paired insulin pump for the purpose of glucose control monitoring. The insulin pump component of the system had a much longer development cycle and therefore caused the delay in the RF submittal.

In past RF submittals, unlaunched, unannounced product information has been provided to the public on the FCC website which has had negative effect on the business. Therefore, the decision was made not to upload RF submissions until just before product launch.

No changes have been made to the MMT-7763, Glucose Sensor Transmitter GST3 hardware (circuit boards, crystals, antenna or enclosure) since the original report release (CKC Test Report Nos.: 93243-15 and 95059-8).
