Section 3. RF Power Output

Para. No.: 2.1046

Test Performed By: Russell Grant	Date of Test: July 14, 2003
---	------------------------------------

Minimum Standard: 22.913(a), 500 W ERP

Test Results: Complies The maximum output power is 12.0 Watts ERP. This is 16.2 dB below the specification limit. The measured output power is within 1 dB of the manufacturers rated output power.

Down Link Rated Output Power: 40 dBm

Up Link: Rated Output Power 30 dBm

	Measured Output Power	Typical Antenna Gain	ERP	
	(dBm)	(dBd)	(dBm)	(Watts)
Up Link	30.1 to 30.3	8	38.3	6.8
Down Link	40.1 to 40.8	0	40.8	12.0

Note: Output power is reduced via AGC according to channel loading.

Down Link per channel power = $\left(\frac{10}{N}\right)Watts$, N=number of channels.

Up Link per channel power = $\left(\frac{1}{N}\right)Watts$, N=number of channels.

Section 4. Occupied Bandwidth

Para. No.: 2.1049

Test Performed By: Russell Grant	Date of Test: July 16, 2003
---	------------------------------------

Minimum Standard: 22.917(a)

Test Results: Complies. There was no degradation in the occupied bandwidth.

Measurement Data: See attached graphs.

The occupied bandwidth was measured by comparison of input to the output signal. This was done in order to determine if there was any degradation to the output signal due to the amplification through the repeater.

Section 5. Spurious Emissions at Antenna Terminals

Para. No.: 2.1051

Test Performed By: Russell Grant	Date of Test: July 16, 2003
---	------------------------------------

Minimum Standard: 22.917(a), -13 dBm

Test Results: Complies. The worst case emission is -18.3 dBm at 878.3 MHz. This is 5.3 dB below the specification limit.

The spectrum was search from 30 MHz up to the 10th harmonic of the fundamental frequency of operation. In the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission was used.

Section 6. Field Strength of Spurious Emissions

Para. No.: 2.1053

Test Performed By: Russell Grant	Date of Test: July 17, 2003
---	------------------------------------

Minimum Standard: 22.917(a), -13 dBm

Test Results: Complies. The strongest emission is -20.4 dBm at 1774 MHz. This is 7.4 dB below the specification limit.

Measurement Data: See attached graph(s).

The spectrum was searched up to the 10th harmonic for both up link and down link. All emissions within 20 dB of the specification limit were measured and reported. Worst case data has been presented.

Radiated Emissions

Emission levels are measured in terms of ERP. All emissions within 20 dB of the specification limit are maximized along 360° azimuth and further maximized by raising and lowering the search antenna from 1 to 4 m. The transmitter under test is replaced with a dipole antenna and calibrated signal generator. The level and frequency of the signal generator are adjusted in order to reproduce the previously detected emission and maximized by varying the height of the search antenna. This procedure is performed for both horizontal and vertical polarization of the detected signal. This test procedure is adopted from ANSI/TIA-603.
