

### Prediction of MPE limit at a given distance

Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = \frac{PG}{4\pi R^2}$$

where: S = power density

P = power input to the antenna

G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna

|                                                              |             |           |
|--------------------------------------------------------------|-------------|-----------|
| Maximum peak output power at antenna input terminal:         | 30.00       | (dBm)     |
| Maximum peak output power at antenna input terminal:         | 1000        | (mW)      |
| Antenna gain(typical):                                       | 2           | (dBi)     |
| Maximum antenna gain:                                        | 1.584893192 | (numeric) |
| Prediction distance:                                         | 20          | (cm)      |
| Prediction frequency:                                        | 869-894     | (MHz)     |
| MPE limit for uncontrolled exposure at prediction frequency: | 1.0         | (mW/cm^2) |
| Power density at prediction frequency:                       | 0.315304    | (mW/cm^2) |
| Maximum allowable antenna gain:                              | 7.012698554 | (dBi)     |
| Margin of Compliance:                                        | 5.012698554 | (dB)      |
