Footnotes:

- 1) The apparatus does not modulate or demodulate the carrier and therefore does not contain any modulation circuitry.
- 2) This equipment uses the same LO for frequency conversion, therefore the transmitted signal is identical in frequency to the received signal. This was verified with frequency counter phase locked to a signal generator and measuring the transmitted signal frequency. The frequency drift was 0 Hz.

Section 4. Occupied Bandwidth

Para. No.: 2.1049

Test Performed By: Jason Nixon	Date of Test: November 29, 2004
---------------------------------------	--

Minimum Standard: Para. No. 90.210

Test Results: Complies

Measurement Data: See attached graphs.

The occupied bandwidth was measured by comparison of input from the signal generator to the output signal from the amplifier. This was done in order to determine if there was any degradation to the output signal due to the amplification and conversion through the repeater.
