ELECTROMAGNETIC EMISSIONS TEST REPORT

according to 47CFR Part 90, subparts I, S
for

Dekolink Wireless Ltd.

EQUIPMENT UNDER TEST:

Digital repeater

Model:MW-DR-800-50W90B

This report is in conformity with ISO/IEC 17025. The A2LA logo endorsement applies only to the test methods and the standards that are listed in the scope of Hermon Laboratories accreditation.
The test results relate only to the items tested. **This test report must not be reproduced in any form except in full with the approval of Hermon Laboratories Ltd.**

1 Project information

Description of equipment under test

Test items	: Digital repeater
Manufacturer	: Dekolink Wireless Ltd.
Types (Models)	: MW-DR-800-50W90B
Software release	: 3.2E
Hardware version	: 01

Applicant information

Applicant's responsible person	: Mr. Alex Baber, project manager
Company	: Dekolink Wireless Ltd.
Address	: 16, Bazel street
Postal code	: 49001
City	: Petach-Tikva
Country	: Israel
Telephone number	: +972-3918 0175
Telefax number	: +972-3918 0190

Test performance

Project Number:	: 15557
Location	: Hermon Laboratories
Receipt date	: May 29, 2003
Test started	: May 29, 2003
Test completed	: July 16, 2003
Purpose of test	: Apparatus compliance verification in accordance with emission requirements
Test specification(s)	47CFR part 90, §§90.205, 90.209, 90.210, 90.635, 90.691 part 15 §15.207, §§15.107, 15.109

2 Summary and signatures

The EUT, MW-DR-800-50W90B digital repeater, was tested according to FCC part 90 subparts I, S, §§90.205(j), 90.209, 90.210, 90.635, 90.691, part 15 §15.207, §§15.107, 15.109 and found to comply with the standard requirements.

Test description	Specification reference	Tested by	Date tested	Test report paragraph	Verdict
RF output power	90.205(j), 90.635	Mrs. E. Pitt, Mr. Y. Neuman, test engineer	June 19, 23, 2003	4.1	Pass
Occupied bandwidth	90.209	Mrs. E. Pitt, Mr. Y. Neuman, test engineer	June 19, July 13, 2003	4.2	Pass
Emission mask	90.210 90.691	Mrs. E. Pitt, Mr. Y. Neuman, test engineer	June 26, 29, 2003	4.3	Pass
Conducted spurious emissions	90.210	Mr. Y. Neuman, test engineer	July 3, 2003	4.4	Pass
Radiated spurious emissions	90.210	Mr. Y. Neuman, test engineer	July 13, 2003	4.5	Pass
Radiated emissions	15.109	Mr. Y. Neuman, test engineer	June 18, 2003	4.6	Pass
Conducted emissions	15.107, 15.207	Mr. Y. Neuman, test engineer	July 10, 2003	4.7	Pass

Test report prepared by:

Mrs. M. Cherniavsky, MSc, certification engineer

Test report approved by:

Mr. Michael Nikishin, MSc, EMC group leader

Mr. Edward Usoskin, PhD, C.E.O.

3 EUT description

3.1 General description

The EUT is a high power repeater intended for outdoor applications to cover large areas. The unit is based on a duplexed path configuration, having sharp out of band attenuation for improved isolation between the receiving and transmitting paths. The repeater downlink path receives the RF signals from a base station, amplifies them and transmits to the subscriber. The repeater uplink path receives the RF signals from the subscriber, amplifies them and transmits to the base station. Two duplexers separate the signals to the proper amplifying path and isolate the two signals.

Downlink frequency range is 851 – 866 MHz, uplink – 806 –821 MHz; RF power of the downlink channel is 10 W, of the uplink channel – 1 W.

The EUT is powered from the mains. The EUT clocks generate 11.0592 MHz, 16 MHz, 65.536 MHz, 791 MHz, 836 MHz.

4 Test results

4.1 Peak output power test according to part 90 §§90.205 (j), 90.635

DATE: June 19, 23, 2003
RELATIVE HUMIDITY: 48 %
AMBIENT TEMPERATURE: 23°C
AIR PRESSURE: 1008 hPa
MEASUREMENT UNCERTAINTY: ± 3.5 dB
OPERATING FREQUENCY RANGE: 851-866 MHz (downlink)
806-821 MHz (uplink)

Mode of operation	Carrier frequency, MHz	Input signal, dBm	Peak output power, dBm	Output power limit, dBm	Nominal* margin, dB	Maximum** margin, dB	Reference to Plots in Appendix A	Verdict
Downlink	858.5125	Max (-23)	39.8	40 $\pm$ 1	0.2	1.2	A1	Pass
		Min (-50)	39.8		0.2	1.2	A2	Pass
Uplink	813.5125	Max (-33)	30.62	30 $\pm$ 1	-0.62	0.38	A3	Pass
		Min (-60)	30.8		-0.8	0.2	A4	Pass

Notes:

*Nominal margin= dB below (negative if above) nominal power limit.

**Maximum margin= dB below (negative if above) declared by manufacturer maximum rated power.

LIMITATION ON POWER

Mode of operation	Output power declared by the manufacturer, dBm	
	Nominal	Rated
Downlink	40	40 $\pm$ 1
Uplink	30	30 $\pm$ 1

TEST PROCEDURE

The EUT RF output was connected to the spectrum analyzer through external attenuator, the settings are shown in the plots. The measurements were performed in downlink and uplink transmit modes of operation at both maximum and minimum input signals at the middle carrier (channel) frequency. Spectrum analyzer readings were corrected for RF path losses.

4.3 Emission mask test according to part 90 §§90.210(b), 90.210(g), 90.691

DATE: July 13, 2003
RELATIVE HUMIDITY: 43 %
AMBIENT TEMPERATURE: 26°C
AIR PRESSURE: 1008 hPa
FREQUENCY RANGE: 9 kHz - 9 GHz
MEASUREMENT UNCERTAINTY: ± 4.5 dB

Emission mask according to §90.210(b):

The power of any emission must be attenuated below the transmitter unmodulated carrier output power (P in watts) as follows:

- 1) On any frequency removed from the assigned frequency by more than 50 percent, but not more than 100 percent of the authorized bandwidth: at least 25 dB
- 2) On any frequency removed from the assigned frequency by more than 100 percent, but not more than 250 percent of the authorized bandwidth: at least 35 dB
- 3) On any frequency removed from the assigned frequency by more than 250 percent of the authorized bandwidth: at least $43 + 10 \log (P)$ dB.

Emission mask according to §90.210(g):

The power of any emission must be attenuated below the transmitter unmodulated carrier output power (P in watts) as follows:

- 1) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 5 kHz, but not more than 10 kHz: at least $83 \log (f_d / 5)$ dB;
- 2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 10 kHz, but not more than 250 percent of the authorized bandwidth: at least $116 \log (f_d / 6.1)$ dB, or $50 + 10 \log (P)$ dB or 70 dB, whichever is the lesser attenuation;
- 3) On any frequency removed from the center of the authorized bandwidth by more than 250 percent of the authorized bandwidth: at least $43 + 10 \log (P)$ dB.

Emission mask according to §90.691:

The power of any emission must be attenuated below the transmitter power (P in watts) as follows:

- 1) For any frequency removed from the economic area licensee's frequency block by up to and including 37.5 kHz by at least $116 \log (f / 6.1)$ dB, or $50 + 10 \log (P)$ dB or 80 dB, whichever is the lesser attenuation, where f is the frequency removed from the center of the outer channel in the block in kHz and where f is greater than 12.5 kHz;
- 2) For any frequency removed from the economic area licensee's frequency block greater than 37.5 kHz by at least $43 + 10 \log (P)$ dB or 80 dB whichever is the lesser attenuation, where f is the frequency removed from the center of the outer channel in the block in kHz and where f is greater than 37.5 kHz.

Test procedure

The EUT RF output was connected to the spectrum analyzer, the settings are shown in the plots. The measurements were performed in downlink and uplink transmit modes of operation at both maximum and minimum input signals.

The emission mask calculated according to formulas (1) – (3) and measured results are shown in Plots A13 to A24. The measurements were performed with one modulated carrier at the middle frequency of the band.

Conducted spurious emissions were measured at the EUT output terminals in the frequency range from 9 kHz up to 9 GHz beyond $\pm 250\%$ of the authorized bandwidth from the carrier.

Three carrier (channel) signals of an equal magnitude, two modulated at one edge and one CW at the other edge of the assigned band, were applied to the EUT input. The specified limit $43 + 10 \log (P)$ was calculated separately for downlink and uplink modes.

For downlink mode the composite output power is 40 dBm or 10 W, for uplink – 30 dBm or 1 W. Output power P for each channel is equal to composite power in watts divided by 3 (or reduced by 4.8 dB) and attenuation limit L below carrier is equal to:

Downlink mode: $L_D \text{ (dB)} = 43 + 10 \log (P) = 43 + 10 \log (10 \text{ W}/3) = 48.23 \text{ dB}$

Uplink mode: $L_U \text{ (dB)} = 43 + 10 \log (P) = 43 + 10 \log (1 \text{ W}/3) = 38.23 \text{ dB}$

These limits were applied to spurious emissions throughout the following frequency ranges:

9 kHz to 850.9625 MHz, 851.0875 to 865.9375 MHz and 866.0375 MHz to 9 GHz (downlink),

9 kHz to 805.9625 MHz, 806.0875 to 820.9375 MHz and 821.0375 MHz to 9 GHz (uplink).

Attenuation below carrier was calculated by subtraction of a measured spurious power from a carrier output power for each channel. The carrier output power for each channel is equal to the composite output power reduced by 4.8 dB: 35.2 dBm for downlink mode, 25.2 dBm for uplink.

For example, plot A30 demonstrates MRK recording -75 dBm , external attenuation is 51 dB, hence, measured spurious emission level is -24 dBm . Attenuation below carrier is equal to $35.2 \text{ dBm} - (-24 \text{ dBm}) = 59.2 \text{ dB}$ at 48.2 dB attenuation limit.

Test results are brought in table below and are shown in Plots A25 to A78.

Radiated spurious emissions – refer to this test report section 4.5.

4.4 Radiated emissions test according to part 90 §§90.210(b), 90.210(g), 90.691

METHOD OF MEASUREMENTS	ANSI 63.4 §13.1.4
DATE:	July 13, 2003
RELATIVE HUMIDITY:	44 %
AMBIENT TEMPERATURE:	26°C
AIR PRESSURE:	1008 hPa
FREQUENCY RANGE	9 kHz - 9 GHz
MEASUREMENT UNCERTAINTY:	± 4.5 dB

Radiated spurious emissions were measured in downlink and uplink modes of operation at both maximum and minimum input signals (minimum and maximum gain). Three carrier (channel) signals of an equal magnitude, two modulated at one edge and one CW at the other edge of the assigned band, were applied to the EUT input.

The measurements were performed at 3-m test distance:
with the loop antenna in the range 9 kHz to 30 MHz (in the anechoic chamber),
the biconilog - in the range 30 MHz to 1000 MHz (in the anechoic chamber),
the double ridged guide – in frequency range from 1000 to 5000 MHz in the anechoic chamber,
from 5000 to 9000 MHz – at the open area test site.
The EUT was set up on the 80 cm height wooden table, as shown in Figures 4.5.1 to 4.5.3.

9 kHz – 30 MHz frequency range. The loop antenna was positioned with its plane vertical. The loop center was 1 meter above the ground plane. To find maximum radiation the turntable was rotated 360 and the measuring antenna was rotated about its vertical axis.

30 MHz – 9 GHz frequency range. To find maximum radiation the turntable was rotated 360°, measuring antenna height was changed from 1 to 4 m, and the antennas polarization was changed from vertical to horizontal.

The specified limit $43 + 10 \log (P)$ was converted in 82.2 dB(μV/m) equivalent field strength at 3 m and this limit was applied to spurious emissions throughout the following frequency ranges:

9 kHz to 850.9625 MHz, 851.0875 to 865.9375 MHz and 866.0375 MHz to 9 GHz (downlink),
9 kHz to 805.9625 MHz, 806.0875 to 820.9375 MHz and 821.0375 MHz to 9 GHz (uplink).

The test results are shown in Plots A79 to A110. All spurious emissions were found at least 20 dB below limit.

TEST EQUIPMENT USED IN ANECHOIC CHAMBER:

Set up for radiated emissions measurement

4.5 Unintentional radiated emissions test according to §15.109

METHOD OF MEASUREMENT: ANSI 63.4 §11.6 / ANSI 63.4 §12.1.4
DATE: June 18, 2003
TEST PERFORMED AT: Anechoic chamber
AMBIENT TEMPERATURE: 23°C
RELATIVE HUMIDITY: 40%
AIR PRESSURE: 1015 hPa
DISTANCE BETWEEN ANTENNA AND EUT: 3 m
THE EUT WAS TESTED AS: Table-top
FREQUENCY RANGE: 30 MHz – 5 GHz
MEASUREMENT UNCERTAINTY: ± 6 dB max

For test procedure and setup refer to section 4.5.

Frequency, MHz	Detector type	RBW, kHz	Ant. type	Ant. polariz.	Ant, hgt, m	TT pos., (°)	Radiated emissions, dB (mV/m)	Limit, dB (mV/m)	Margin, dB	Verdict
65.553	QP	120	BL	Vertical	1.0	356	37.65	40.0	2.35	Pass

5 - 30	60	50

*The limit decreases linearly with the logarithm of frequency.

TEST PROCEDURE

The measurements were performed at mains terminals by means of LISN, connected to spectrum analyzer in the frequency range as referred to in the table above. The unused coaxial connector of the LISN was terminated with 50 Ω. The measurements were made with quasi-peak and average detectors as referred to in the tables. The position of the EUT cables was varied to determine maximum emission level.

Appendix A Plots

Plot A 1

Peak output power measurements

Mode downlink
Test method: measurement at antenna connector
Notes Input signal – maximum (-23 dBm)

$P_{out} = -30 \text{ dBm} + 69.8 \text{ dB} = 39.8 \text{ dBm}$
External attenuation 69.8 dB

Plot A 2

Peak output power measurements

Mode downlink
Test method: measurement at antenna connector
Notes Input signal – minimum (-50 dBm)

$P_{out} = -30 \text{ dBm} + 69.8 \text{ dB} = 39.8 \text{ dBm}$
External attenuation 69.8 dB

Plot A 3

Peak output power measurements

Mode: uplink
Test method: measurement at antenna connector
Notes: Input signal – maximum (-33 dBm)

$P_{out} = -30.18 \text{ dBm} + 60.8 \text{ dB} = 30.62 \text{ dBm}$
External attenuation 60.8 dB

Plot A 4

Peak output power measurements

Mode: uplink
Test method: measurement at antenna connector
Notes: Input signal – minimum (-60 dBm)

$P_{out} = -30.0 \text{ dBm} + 60.8 \text{ dB} = 30.8 \text{ dBm}$
External attenuation 60.8 dB

Plot A 5

Occupied bandwidth at the EUT input

Appendix D General information

Test facility description

Tests were performed at Hermon Laboratories Ltd., which is a fully independent, private, EMC, safety, environmental and telecommunication testing facility. Hermon Laboratories is listed by the Federal Communications Commission (USA) for all parts of Code of Federal Regulations 47 (CFR 47) and by Industry Canada for electromagnetic emissions (file numbers IC 2186-1 for OATS and IC 2186-2 for anechoic chamber), certified by VCCI, Japan (the registration numbers are R-808 for OATS, R-1082 for anechoic chamber, C-845 for conducted emissions site), assessed by TNO Certification EP&S (Netherlands) for a number of EMC, telecommunications, environmental, safety standards, and by AMTAC (UK) for safety of medical devices. The laboratory is accredited by American Association for Laboratory Accreditation (USA) according to ISO/IEC 17025 for electromagnetic compatibility, product safety, telecommunications testing and environmental simulation (for exact scope please refer to Certificate No. 839.01) and approved by Israel Ministry of environmental protection, radiation hazards department (Permit number 1158).

Address: PO Box 23, Binyamina 30500, Israel.

Telephone: +972 4628 8001

Fax: +972 4628 8277

e-mail: mail@hermonlabs.com

website: www.hermonlabs.com

Person for contact: Mr. Alex Usoskin, QA manager.

Abbreviations and acronyms

The following abbreviations and acronyms are applicable to this test report:

AC	alternating current
cm	centimeter
CW	continuous wave
dB	decibel
dBm	decibel referred to one milliwatt
dB(μ V)	decibel referred to one microvolt
dB(μ V/m)	decibel referred to one microvolt per meter
EMC	electromagnetic compatibility
EUT	equipment under test
GHz	gigahertz
H	height
Hz	hertz
kHz	kilohertz
kV	kilovolt
L	length
m	meter
MHz	megahertz
NA	not applicable
QP	quasi-peak
RF	radio frequency
rms	root mean square
s	second
V	volt
W	width
