

Description of Use for REDEEM™ Transmitter Model 6000-4

The REDEEM™ transmitter is a professional incontinence management system designed to sense a fluid release from patients in nursing home or hospital. The transmitter (model 6000-4) is attached to a Sense'R Strip® that recognizes a wet condition in the patient's bed. When a wet condition is detected, the transmitter is activated and sends a coded transmission to the companion REDEEM™ receiver (model 6000-3) located at the nurse's station. The transmitter receives power from a 9-volt battery.
