

OPERATIONAL DESCRIPTION

This product consists of a transmitter and receiver. The hunter/dog handler carries the transmitter and the dog wears the receiver. The receiver emits audio tones which lets the handler locate the dog in heavy cover. It also lets the handler discipline the dog for wrong doings ie, chasing unwanted game, prematurely flushing game, or ranging out too far. It operates at 418 MHz and has four functions which are done by changing the encoder data which in turn results in a different output at the receiver
