1 General Information

The following Certification Report is prepared on behalf of **M/A-COM, Inc.** in accordance with the Federal Communications Commission and Industry Canada. The Equipment Under Test (EUT) was the **M7100 UHF-L Mobile Radio, FCC ID: OWDTR-0020-E, IC: 3636B-0020**. The test results reported in this document relate only to the item that was tested.

All measurements contained in this application were conducted in accordance with the applicable FCC Rules and Regulations in CFR 47. Calibration checks are performed regularly on the instruments, and all accessories including high pass filter, coaxial attenuator, preamplifier and cables.

1.1 Test Facility

The open area test site and conducted measurement facility used to collect the radiated data is located on the parking lot of Rhein Tech Laboratories, Inc., 360 Herndon Parkway, Suite 1400, Herndon, Virginia, 20170. This site has been fully described in a report submitted to and approved by the Federal Communications Commission to perform AC line conducted and radiated emissions testing.

1.2 Related Submittal(s)/Grant(s)

The purpose of this Class II Permissive Change is to add wall mount and desktop control station configurations which contain the original radio. There have been no changes to the original radio. These configuration additions are considered accessories to the basic mobile radio. Since these configurations are powered from the AC mains (and the radio in the original submittal was not), AC line conducted emissions are submitted. Unintentional digital radiated emissions are also contained in this report for reference.

The original FCC grant was issued March 11, 2004; permissive change grant issued April 26, 2005.

2 Tested System Details

The test sample was received on August 7, 2007. The identifiers and descriptions of all equipment, cables, and internal devices used with the EUT for this test are list below.

Table 2-1: Equipment under Test (EUT)

Part	Manufacturer	Model	PN/SN	FCC ID	Cable Description	RTL Bar Code
M7100 Wall Mount Station	M/A-COM, Inc.	M7100	DSWD02	N/A	3 m RF Coax Cable, 3 m RJ-11 Tone Remote Interconnect Cable, 2.2 m AC Power Cable (gray), 2.2 m AC Power Cable (black), installed internal to wall mount	18064
M7100 Desktop Station	M/A-COM, Inc.	M7100	DSDX07-VS with RU101188V12 Radio (UHF-L, 50 Watts)	N/A	RJ-11 Tone Remote Interconnect Cable, AC Power Cable (black), installed on desktop	18063
M7100 UHF-L	M/A-COM, Inc.	MAHG-SNMXX	9810975	OWDTR-0020-E	N/A	18066

Table 2-2: Support Equipment

Part	Manufacturer	Model	PN/SN	FCC ID	Cable Description	RTL Bar Code
Handset/ Microphone	M/A-COM, Inc.	N/A	19C851086P15	N/A	1.5 m unshielded I/O	18058
IDA Tone Remote Base Controller	M/A-COM, Inc.	24-66H	06-44-163J.35	N/A	1.7 m unshielded Power; 3 m unshielded I/O; 0.4 m unshielded handset (coiled)	18059

3 Radiated Emissions

3.1 Amendments to Emissions Test Methodology

3.1.1 Deviations from Test Methodology

There was no deviation from, additions to, or exclusions from, the test method.

3.2 Radiated Emissions Measurements

3.2.1 Site and Test Description

Before final radiated emissions measurements were made on the OATS, the EUT was scanned indoors at both one and three meter distances. This was done in order to determine its emission spectrum signal. The physical arrangement of the test system and associated cabling was varied in order to determine the effect on the EUT's emissions in amplitude, direction and frequency. This process was repeated during final radiated emission measurements on the OATS, at each frequency, in order to ensure that maximum emission amplitudes were measured. Final radiated emissions measurements were made on the OATS at a distance of 3 meters. The EUT was placed on a non-conductive turntable. At each frequency, the EUT was rotated 360°, and the antenna was raised and lowered from 1 to 4 meters in order to determine the emissions maximum levels. Measurements were taken using both horizontal and vertical antenna polarization. The spectrum analyzer's 6 dB bandwidth was set to 120 kHz, and the analyzer was operated in the quasi-peak detection mode. No video filter less than 10 times the resolution bandwidth was used. The highest emission amplitudes relative to the appropriate limit were measured and recorded in this report.

3.2.2 Field Strength Calculations

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$$FI(dB\mu V / m) = SAR(dB\mu V) + SCF(dB / m)$$

FI = Field Intensity

SAR = Spectrum Analyzer Reading

SCF = Site Correction Factor

The Site Correction Factor (SCF) used in the above equation is determined empirically, and is expressed in the following equation:

$$SCF(dB / m) = -PG(dB) + AF(dB / m) + CL(dB)$$

SCF = Site Correction Factor

PG = Pre-Amplifier Gain

AF = Antenna Factor

CL = Cable Loss

The field intensity in microvolts per meter can then be determined according to the following equation:

$$FI(\mu V / m) = 10^{FI(dB\mu V / m) / 20}$$

For example, assume a signal frequency of 125 MHz has a received level measured as 49.3 dBuV. The total Site Correction Factor (antenna factor plus cable loss minus preamplifier gain) for 125 MHz is -11.5 dB/m. The actual radiated field strength is calculated as follows:

$$49.3dB\mu V - 11.5dB / m = 37.8dB\mu V / m$$

$$10^{37.8 / 20} = 10^{1.89} = 77.6\mu V / m$$

3.2.3 Measurement Uncertainty

Rhein Tech Laboratories, Inc. has implemented procedures to minimize errors that occur from test instruments, calibration, procedures, and test setups. Test instrument and calibration errors are documented from the manufacturer or calibration lab. Other errors have been defined and calculated within the Rhein Tech Quality Manual, Section 6.1. Rhein Tech implements the following procedures to minimize errors that may occur: yearly as well as daily calibration methods, technician training, and emphasis to employees on avoiding error.

3.2.4 Test Limits

FCC Class B Radiated Emissions	
Frequency (MHz)	At 3m (dB μ V/m)
30-88	40.0
88-216	43.5
216-960	46.0
>1000	54

4 AC Conducted Emissions - FCC Rules and Regulations Part 15 §15.207; RSS-Gen 7.2.2: Conducted Limits

4.1 Site and Test Description

The power line conducted emissions measurements were performed in a Series 81 type shielded enclosure manufactured by Rayproof. The EUT was assembled on a wooden table 80 centimeters high. Power was fed to the EUT through a 50-ohm/50 microhenry Line Impedance Stabilization Network (LISN). The EUT LISN was fed power through an A.C. filter box on the outside of the shielded enclosure. The filter box and EUT LISN housing are bonded to the ground plane of the shielded enclosure. A second LISN, the peripheral LISN, provides isolation for the EUT test peripherals. This peripheral LISN was also fed A.C. power. A metal power outlet box, which is bonded to the ground plane and electrically connected to the peripheral LISN, powers the EUT host peripherals.

The spectrum analyzer was connected to the A.C. line through an isolation transformer. The 50-ohm output of the EUT LISN was connected to the spectrum analyzer input through a Solar 100 kHz high-pass filter. The filter is used to prevent overload of the spectrum analyzer from noise below 100 kHz. Conducted emission levels were measured on each current-carrying line with the spectrum analyzer operating in the CISPR quasi-peak mode (or peak mode if applicable).

The analyzer's 6 dB bandwidth was set to 9 kHz. Video filter less than 10 times the resolution bandwidth is not used. Average measurements are performed in linear mode using a 10 kHz resolution bandwidth, a 1 Hz video bandwidth, and by increasing the sweep time in order to obtain a calibrated measurement. The emission spectrum was scanned from 150 kHz to 30 MHz. The highest emission amplitudes relative to the appropriate limits were measured and have been recorded.

4.2 Test Limits

Class A Line-Conducted Emissions		
Limit (dB μ V)		
Frequency (MHz)	Quasi-Peak	Average
0.15 to 0.50	79	66
0.50 to 30.0	73	60

Class B Line-Conducted Emissions		
Limit (dB μ V)		
Frequency (MHz)	Quasi-Peak	Average
0.15 to 0.50	66 to 56	56 to 46
0.50 to 5.00	56	46
5.00 to 30.00	60	50

Table 4-1: Conducted Emissions Test Equipment

<http://www.rheintech.com>

Client: M/A-COM, Inc.
Model: M7100^{IP} UHF-L Mobile Radio
Standards: FCC Part 90/RSS-119
ID's: OWDTR-0020-E/3636B-0020
Report Number: 2007210

5 Conclusion

The data in this measurement report shows that the **M/A-COM, Inc.** Model **M7100 UHF-L Mobile Radio, FCC ID: OWDTR-020-E, IC: 3636B-0020**, when used in control station applications, complies with all the applicable requirements of FCC Parts 90, 15 and 2 and Industry Canada RSS-119.
