RE: M/A-COM Inc.

FCC ID: OWDTR-0022-E

After a review of the submitted information, I have a few comments on the above referenced Application.

1) The response appears to state that only certain modulations are used in certain bands. Is this correct? Information in the 731 and test report did not reflect this. If this is correct, please adjust the cover page and page 7 of the test report and 731 form to correctly show which modulations are being approved for which bands. These documents suggest that all modulations operate in all bands, which has created the previous questions.

Also, please note that the last response did not address the 4 level modulation. Additionally please note that 4 level modulation data appears to suggest operation in all bands. Please justify the use of 4 level modulation in all bands, and explain why all other modulations only appear in certain bands.

Additionally, please note that the data does not appear to match the response (i.e. Wideband Data and Voice were not tested to Mask G) as given in the response. Please clarify. Additionally, it is uncertain why some voice modulations are subject to low pass filter masks, and others are not. Please explain.

Response: A revised 731 form and a revised test report have been uploaded, including Mask G Wideband data/voice plots.

C4FM is intended to be used in both sets of sub-bands, 806-821/851-866 MHz and 821-824/866-869 MHz. 4 level (C4FM) is Project 25 and detailed in TIA/EIA documents. It is used across these bands because this is what is needed to be compliant with competitive Project 25 trunked systems and our customers' needs.

Other modulations appear in certain band segments because this product needs to work with legacy systems (backward compatibility), pre Project 25 introduction.

Only analog voice is subject to low pass filter masks. 2-level and 4-level modulations are subject to non-low pass filter masks.
