

According to KDB 447498 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance ≤ 50 mm are determined by:

$$[(\text{max. power of channel, including tune-up tolerance, mW})/(\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] \leq 3.0$$

*The max. power of channel, including tune-up tolerance (Tolerance : 2dBm) (mW) is **0.3 mW @2402MHz (With Tune-up tolerance)***

*The min. test separation distance (mm) is **5 mm**.*

So,

$$[(\text{max. power of channel, including tune-up tolerance, mW})/(\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] = 0.093 < 3.0 \quad (\text{With Tune-up tolerance})$$

So standalone SAR measurements are not required for both head and body.
