Re: Concerns About Packaging and FCC Label for P6F4LTX

Date: June 19, 2014

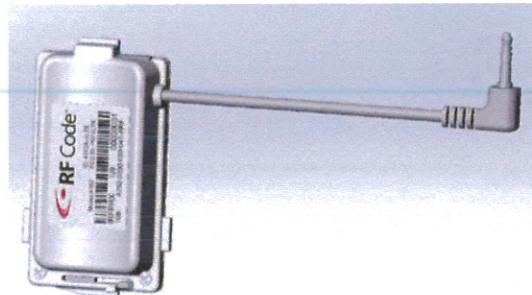

MET Laboratories, Inc.
914 West Patapsco Avenue
Baltimore, MD 21230

To Whom It May Concern:

RF Code packages and ships this A762 device as an electronic module in an injection molded enclosure with an external label that includes the FCC ID.

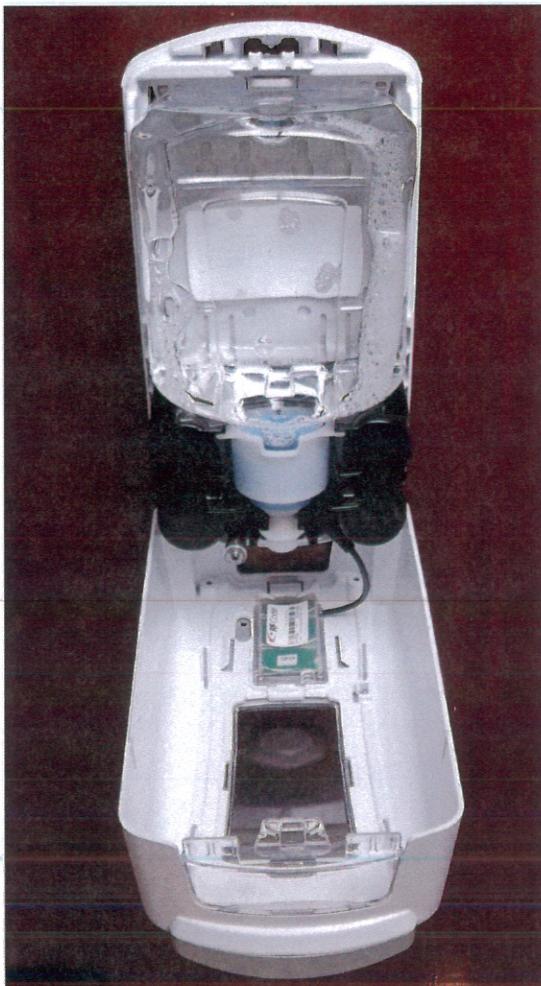

The label is affixed to the curved surface of the module as shown:

Modules are then packed and shipped in layers of die-cut foam, similar to the following:

The installer must physically handle the module and reference this label prior to use. The label also includes a barcode representation of the unique device ID. In the software, the user enters the device ID and completes a field noting the physical location where each device is installed. It is not possible to deploy the system without actually seeing the FCC ID on the label on the module and the label remains visible for the duration of the deployment, similar to the following:

Each hospital will have ~2.5 soap and alcohol dispensers per licensed patient bed. The RFID asset tracking system and the hand hygiene infrastructure are typically managed by the Biomed department. Administrators over-provision hardware orders to maintain an inventory of spare modules, so in this case, these spares could provide an additional way for the user to easily reference the FCC ID.

Thank you,
