Verificate of Compliance

APPLICANT : **UNIWIDE Technologies., Inc**
EUT Type : **Server Computer**
Model Name : **P4010**
Serial No : **N/A**
Manufacturer Name : **UNIWIDE Technologies., Inc**
Address & Country : **75-6, Samseoung-Dong, Kangnam-Gu,
Seoul, Korea.**
Rule Part(s): : **FCC 15 Subpart B**
Equipment Class : **Class B**

This device has been shown to be capable of compliance with the applicable technical standard as indicated in the measurement report and was tested in accordance with the measurement procedures specified in ANSI C63.4-1992 with the following remarks
(Note codes): (#37)

I attest to the accuracy of data and all measurements reported herein were performed by me or were made under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

Report No: **DAC02-K0164**

Issued Date : **March 8, 2002**

In-Young, Chung.

Date of Test(s) : **Feb 21, 2002**

Place of Tests : **Dastek EMC Lab, in Korea.**

Test Report No : **DAC02-K0164**

Introduction

These measurement tests were conducted at *Dastek EMC Laboratory* facility in Korea. The site address is 204 Chege-Ri, Yangji-Myeon, Yongin-City, Kunggi-Do, Korea. *Dastek EMC Laboratory* is a company that has started the July of 1981, for manufacturing of EMI noise filters and EMI Test and diverging service.

The area of test site is located at 54 Kilometers (33miles) southeast from seoul International Airport, 42 Kilometers (26miles) south-southeast from central seoul where ambient radio signal conditions are quiet and a favorable area to measure the radio frequency interference on open field test site for the computing devices manufacturers.

The detailed description of the measurement facility was found to be in compliance with the requirements of section 2.948 according to ANSI C63.4 on November 02, 2000(Registration Number:90547).

Product Information

Equipment Description

The Equipment under Test (EUT) is the server computer of **UNIWIDE Technologies., Inc.**

Description of Tests

Conducted Emissions

The line conducted facility is located inside a 4.6(m)x6.5(m)x2.5(m) shielded room.

A wooden table 80cm high is located on one side of the shielded room; desktop EUTs are placed on top of this table.

The rear of the EUT is placed a minimum of 40cm from the shielded room wall.

The side of the EUT is 1m from the LISN, which is bonded to the shielded room wall via a 1-foot wide bonding strap.

The LISN is isolated from the other filtered power via an additional filter to ensure that RFI from the auxiliary instrumentation (scopes, etc.) does not influence the readings.

The excess power cord from the EUT is folded back and forth to form a 30-40cm non-inductive bundle. All interconnecting cables more than 1 meter were shortened by non-inductive bundling (serpentine fashion) to a 1 meter length.

Sufficient time for the EUT, support equipment, and test equipment was allowed in order for them to warm up to their normal operating condition.

The RF output of the LISN was connected to the spectrum analyzer to determine the frequency producing the maximum EMI from the EUT.

The spectrum was scanned from 450KHz to 30MHz with 20 msec sweep time.

The frequency producing the maximum level was reexamined using Quasi-Peak adapter.

The detector function was set to CISPR quasi-peak mode.

The bandwidth of the receiver was set to 9KHz.

The EUT, support equipment, and interconnecting cables were arranged and manipulated to maximize each EMI emission.

Each emission was maximized by: switching power lines, varying the mode of operation or resolution, clock or data exchange speed, scrolling H pattern to the EUT and/or support equipment, and powering the monitor from the floor mounted outlet box and the computer aux AC outlet, if applicable; whichever determined the worst-case emission.

Photographs of the worst-case emission can be seen in Appendix C.

Radiated Emissions

Preliminary measurements were made indoors at 1 meter using broadband antennas, broadband amplifier, and spectrum analyzer to determine the frequency producing the maximum EMI.

Appropriate precaution was taken to ensure that all EMI from the EUT were maximized and investigated. The system configurations, clock speed, mode of operation or video resolution, turntable azimuth with respect to the antenna were noted for each Frequency found. The spectrum was scanned from 30 to 200 MHz using biconical antenna and 200 to 1000 MHz using log-periodic antenna.

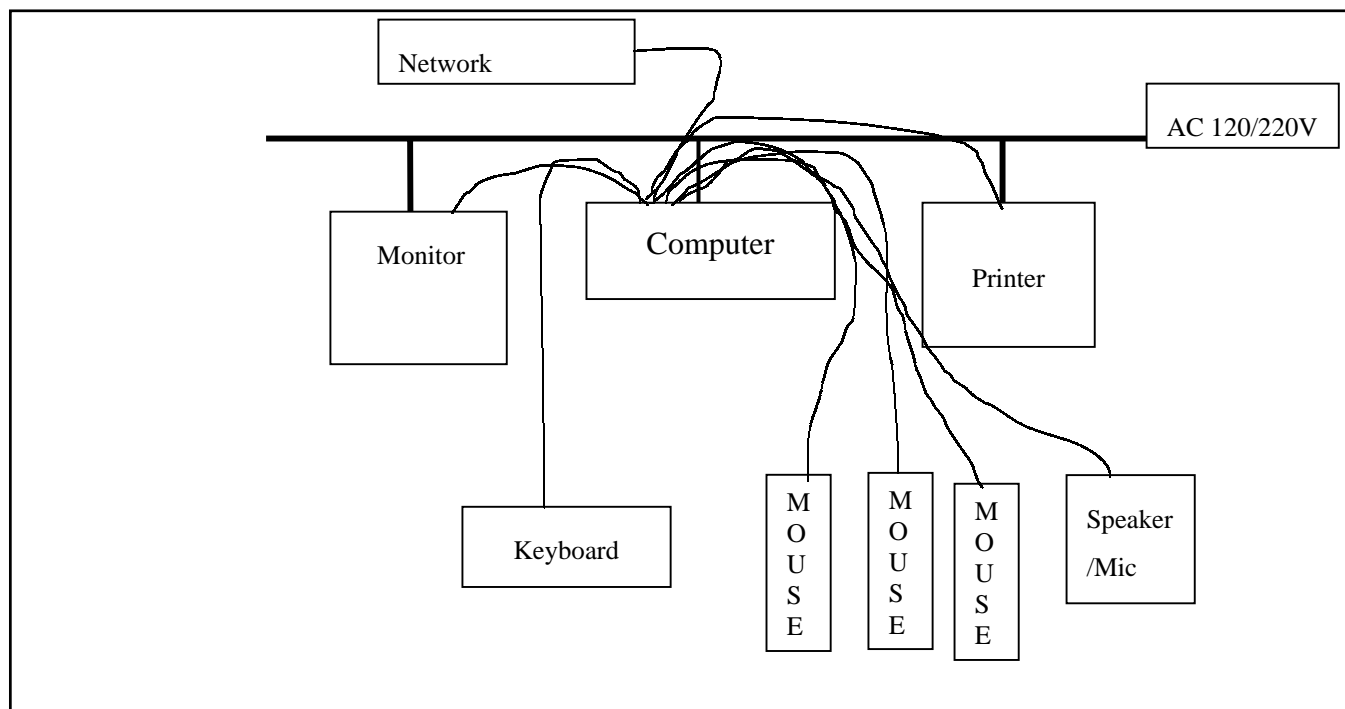

Final measurements were made outdoors at 10-meter test range using biconical and log periodic antennas. The test equipment was placed on a wooden and plastic bench situated on a 1.5 x 2-meter area adjacent to the measurement area. Sufficient time for the EUT, support equipment, and test equipment was allowed in order for them to warm up to their normal operating condition. Each frequency found during pre-scan measurements was re-examined and investigated using Quasi Peak Adapter. The detector function was set to CISPR quasi peak mode and the bandwidth of the receiver was set to 100KHz or 1MHz depending on the frequency or type of signal.

The antenna was turned to the frequency found during preliminary radiated measurements. The EUT, support equipment and interconnecting cables were reconfigured to the set-up producing the maximum emission for the frequency and were placed on top of a 0.8 meter high nonmetallic 1 x 1.5 meter table. The EUT, support equipment, and interconnecting cables were re-arranged and manipulated to maximize each EMI emission. The turntable containing the system was rotated: the antenna height was varied 1 to 4 meters and stopped at the azimuth or height producing the maximum emission. Each emission was maximized by: varying the mode of operation or resolution; clock or data exchange speed; scrolling H pattern to the EUT and/or support equipment, and powering the monitor from the floor mounted outlet box and the computer aux AC outlet, if applicable; and changing the polarity of the antenna, whichever determined the worst-case emission. Photographs of the worst-case emission can be seen in Appendix C.
