To Whom It May Concern

Subject: Radio Configuration Software

Applicant: RF DataTech
FCC ID: P8W-ZRT470

Dear Sir/Madam,

We declare that the only software available to any third party users for use with this product will only allow setting of power, modulation and frequency within a limited range of factory pre-set values which were tested during certification.

For example, they can select the desired data rate and associated modulation method (1200bps FSK, 2400bps FFSK, 4800bps GMSK, 9600bps 4-FSK) . These four modulation methods were individually tested for compliance. The software does not allow the user to change the nature of this modulation or to select any other type of modulation. They can select the transmit power that they wish to use from the hardware set range. The radios were tested over this range. They can also select the spot frequency that they wish to use from within the factory set range which was tested for compliance.

The software will not allow anyone outside our company to change the factory set transmit power range, modulation types or frequency range.

A handwritten signature in black ink that reads "Kenneth J. Ovens".
