## CERTIFICATE OF COMPLIANCE SAR EVALUATION

Welch Allyn Inc.  
8500 SW Creekside Place  
Beaverton, OR 97008

Dates of Test: September 11-12, 2007

Test Report Number: SAR.20070909

Revision B

Welch Allyn Test Report Number: 831-1428-00 Rev. A

FCC ID:	PGUWA11A07
IC Certificate:	4168A-WA1107A
Model(s):	408
Conexant WLAN:	2 Chip Solution - Transceiver CX50222; Baseband CX53822
Test Sample:	Production
Serial No.:	HD000288
Equipment Type:	Wireless Vital Signs Monitor
Classification:	Portable Transmitter Next to Body
TX Frequency Range:	5180 – 5250 MHz, 5250 – 5320 MHz, 5500 – 5700 MHz, 5745 – 5825 MHz
Frequency Tolerance:	± 25 ppm
Maximum RF Output:	5200 MHz – 16.2 dBm, 5300 MHz – 16.1 dBm, 5600 – 16.7 dBm, 5800 MHz – 16.1 dBm Conducted
Signal Modulation:	OFDM
Antenna Type (Length):	Ethertronics GB04001
Battery:	Sanyo Model UR18650F
Application Type:	Certification
FCC Rule Parts:	Part 15E
Industry Canada:	RSS-102

This wireless mobile and/or portable device has been shown to be compliant for localized specific absorption rate (SAR) for uncontrolled environment/general exposure limits specified in ANSI/IEEE Std. C95.1-1999 and had been tested in accordance with the measurement procedures specified in IEEE 1528-2003, OET Bulletin 65 Supp. C, RSS-102 and Safety Code 6 (See test report).

I attest to the accuracy of the data. All measurements were performed by myself or were made under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

RF Exposure Lab, LLC certifies that no party to this application has been denied FCC benefits pursuant to Section 5301 of the Anti-Drug Abuse Act of 1988, 21 U.S.C. 853(a).

Jay M. Moulton  
Vice President

Certificate # 2387.01

## 1. Introduction

This measurement report shows compliance of the Welch Allyn Inc. Model 408 FCC ID: PGUWA11A07 with FCC Part 2, 1093, ET Docket 93-62 Rules for mobile and portable devices and IC Certificate: 4168A-WA1107A with RSS102 & Safety Code 6. The FCC have adopted the guidelines for evaluating the environmental effects of radio frequency radiation in ET Docket 93-62 on August 6, 1996 to protect the public and workers from the potential hazards of RF emissions due to FCC regulated portable devices. [1], [6]

The test procedures, as described in ANSI C95.1 – 1999 Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz [2], ANSI C95.3 – 2002 Recommended Practice for the Measurement of Potentially Hazardous Electromagnetic Fields [3], FCC OET Bulletin 65 Supp. C – 2001 [4], IEEE Std.1528 – 2003 Recommended Practice [5], and Industry Canada Safety Code 6 Limits of Human Exposure to Radiofrequency Electromagnetic Fields in the Frequency Range from 3kHz to 300 GHz were employed.

### SAR Definition [5]

Specific Absorption Rate is defined as the time derivative (rate) of the incremental energy ( $dW$ ) absorbed by (dissipated in) an incremental mass ( $dm$ ) contained in a volume element ( $dV$ ) of a given density ( $\rho$ ).

$$SAR = \frac{d}{dt} \left( \frac{dW}{dm} \right) = \frac{d}{dt} \left( \frac{dW}{\rho dV} \right)$$

SAR is expressed in units of watts per kilogram (W/kg). SAR can be related to the electric field at a point by

$$SAR = \frac{\sigma |E|^2}{\rho}$$

where:

$\sigma$  = conductivity of the tissue (S/m)

$\rho$  = mass density of the tissue (kg/m<sup>3</sup>)

$E$  = rms electric field strength (V/m)

## 2. SAR Measurement Setup

### Robotic System

The measurements are conducted utilizing the ALSAS-10-U automated dosimetric assessment system. The ALSAS-10-U is designed and manufactured by Aprel Laboratories in Nepean, Ontario, Canada. The system utilizes a Robcomm 3 robot manufactured by ThermoCRS located in Michigan USA.

### System Hardware

The system consists of a six axis articulated arm, controller for precise probe positioning (0.05 mm repeatability), a power supply, a teach pendant for teaching area scans, near field probe, an IBM Pentium 4™ 2.66 GHz PC with Windows XP Pro™, and custom software developed to enable communications between the robot controller software and the host operating system.

An amplifier is located on the articulated arm, which is isolated from the custom designed end effector and robot arm. The end effector provides the mechanical touch detection functionality and probe connection interface. The amplifier is functionally validated within the manufacturer's site and calibrated at NCL Calibration Laboratories. A Data Acquisition Card (DAC) is used to collect the signal as detected by the isotropic e-field probe. The DAC manufacturer calibrates the DAC to NIST standards. A formal validation is executed using all mechanical and electronic components to prove conformity of the measurement platform as a whole.

### System Description

The ALSAS-10-U has been designed to measure devices within the compliance environment to meet all recognized standards. The system also conforms to standards, which are currently being developed by the scientific and manufacturing community.

The course scan resolution is defined by the operator and reflects the requirements of the standard to which the device is being tested. Precise measurements are made within the predefined course scan area and the values are logged.

The user predefines the sample rate for which the measurements are made so as to ensure that the full duty-cycle of a pulse modulation device is covered during the sample. The following algorithm is an example of the function used by the system for linearization of the output for the probe.

$$V_i = U_i + U_i^2 \bullet \frac{cf}{dcp_i}$$

The April E-Field probe is evaluated to establish the diode compression point.

A complex algorithm is then used to calculate the values within the measured points down to a resolution of 1mm. The data from this process is then used to provide the co-ordinates from which the cube scan is created for the determination of the 1 g and 10 g averages.

Cube scan averaging consists of a number of complex algorithms, which are used to calculate the one, and ten gram averages. The basis for the cube scan process is centered on the location where the maximum measured SAR value was found. When a secondary peak value is found which is within 60% of the initial peak value, the system will report this back to the operator who can then assess the need for further analysis of both the peak values prior to the one and ten-gram cube scan averaging process. The algorithm consists of 3D cubic Spline, and Lagrange extrapolation to the surface, which form the matrix for calculating the measurement output for the one and ten gram average values. The resolution for the physical scan integral is user defined with a final calculated resolution down to 1mm.

In-depth analysis for the differential of the physical scanning resolution for the cube scan analysis has been carried out, to identify the optimum setting for the probe positioning steps, and this has been determined at 8mm increments on the X, & Y planes. The reduction of the physical step increment increased the time taken for analysis but did not provide a better uncertainty or return on measured values.

The final output from the system provides data for the area scan measurements, physical and splined (1mm resolution) cube scan with physical and calculated values (1mm resolution).

The overall uncertainty for the methodology and algorithms the ALSAS-10-U used during the SAR calculation was evaluated using the data from IEEE 1528 f3 algorithm:

$$f_3(x, y, z) = A \frac{a^2}{\frac{a^2}{4} + x'^2 + y'^2} \left( e^{-\frac{2z}{a}} + \frac{a^2}{2(a + 2z)^2} \right)$$

The probe used during the measurement process has been assessed to provide values for diode compression. These values are calculated during the probe calibration exercise and are used in the mathematical calculations for the assessment of SAR.

## E-Field Probe

The E-field probe used by RF Exposure Lab, LLC, has been fully calibrated and assessed for isotropic, and boundary effect. The probe utilizes a triangular sensor arrangement as detailed in the diagram below right.

**Δ-BEAM**

The SAR is assessed with the probe which moves at a default height of 5mm from the center of the diode, which is mounted to the sensor, to the phantom surface (Z height). The diagram above right shows how the center of the sensor is defined with the location of the diode placed at the center of the dipole. The 5mm default in the Z axis is the optimum height for assessing SAR where the boundary effect is at its least, with the probe located closest to the phantom surface (boundary).

The manufacturer specified precision of the robot is  $\pm 0.05$  mm and the precision of the APREL bottom detection device is  $\pm 0.1$  mm. These precisions are calibrated and tested in the manufacturing process of the bottom detection device. A constant distance is maintained because the surface of the phantom is dynamically detected for each point. The surface detection algorithm corrects the position of the robot so that the probe rests on the surface of the phantom. The probe is then moved to the measurement location 2.44 mm above the phantom surface resulting in the probe center location to be at 4.0 mm above the phantom surface. Therefore, the probe sensor will be at 4.0 mm above the phantom surface  $\pm 0.1$  mm for each SAR location for frequencies below 3 GHz. The probe is moved to the measurement location 1.44 mm above the phantom surface resulting in the probe center location to be at 2.0 mm above the phantom surface. Therefore, the probe sensor will be at 2.0 mm above the phantom surface  $\pm 0.1$  mm for each SAR location for frequencies above 3 GHz.

The probe boundary effect compensation cannot be disabled in the ALSAS-10U testing system. The probe tip will always be at least half a probe tip diameter from the phantom surface. For frequencies up to 3 GHz, the probe diameter is 5 mm. With the sensor offset set at 1.54 mm (default setting), the sensor to phantom gap will be 4.0 mm which is greater than half the probe tip diameter. For frequencies greater than 3 GHz, the probe diameter is 3 mm. With the sensor offset set at 0.56 mm (default setting), the sensor to phantom gap will be 3.0 mm which is greater than half the probe tip diameter.

The separation of the first 2 measurement points in the zoom scan is specified in the test setup software. For frequencies below 3 GHz, the user must specify a zoom scan resolution of less than 6 mm in the z-axis to have the first two measurements within 1 cm of the surface. The z-axis is set to 4 mm as shown on each of the data sheets in Appendix B. For frequencies above 3 GHz, the user must specify a zoom scan resolution of less than 3 mm in the z-axis to have the first two measurements within 5 mm of the surface. The z-axis is set to 2 mm as shown on each of the data sheets in Appendix B.

### 3. Robot Specifications

#### Specifications

Positioner:	ThermoCRS, Robot Model: Robocomm 3
Repeatability:	0.05 mm
No. of axis:	6

#### Data Acquisition Card (DAC) System

##### Cell Controller

Processor:	Pentium 4™
Clock Speed:	2.66 GHz
Operating System:	Windows XP Pro™

##### Data Converter

Features:	Signal Amplifier, End Effector, DAC
Software:	ALSAS 10-U Software

##### E-Field Probe

Model:	Various See Probe Calibration Sheet
Serial Number:	Various See Probe Calibration Sheet
Construction:	Triangular Core Touch Detection System
Frequency:	10MHz to 6GHz

##### Phantom

Phantom:	Uniphantom, Right Phantom, Left Phantom
----------	---

## **4. Probe and Dipole Calibration**

**See Appendix D and E.**

## 5. Phantom & Simulating Tissue Specifications

### SAM Phantom

The Aprel system utilizes three separate phantoms. Each phantom for SAR assessment testing is a low loss dielectric shell, with shape and dimensions derived from the anthropomorphic data of the 90<sup>th</sup> percentile adult male head dimensions as tabulated by the US Army. The SAM phantom shell is bisected along the mid sagittal plane into right and left halves. The perimeter sidewalls of each phantom half is extended to allow filling with liquid to a depth of 15 cm that is sufficient to minimize reflections from the upper surface [5]. See photos in Appendix C.

### Brain & Muscle Simulating Mixture Characterization

The brain and muscle mixtures consist of a glycol based chemical and saline solution. The mixture is calibrated to obtain proper dielectric constant (permittivity) and conductivity of the desired tissue. The head tissue dielectric parameters recommended by the IEEE SCC-34/SC-2 have been incorporated in the following tables. Other head and body tissue parameters that have not been specified in P1528 are derived from the issue dielectric parameters computed from the 4-Cole-Cole equations.

**Table 5.1 Typical Composition of Ingredients for Tissue**

Ingredients		Simulating Tissue		
		5200 MHz Muscle	5600 MHz Muscle	5800 MHz Muscle
Mixing Percentage				
Water		58.85	59.00	59.00
Sugar		41.00	40.60	40.60
Salt		0.00	0.00	0.00
HEC		0.10	0.30	0.30
Bactericide		0.05	0.10	0.10
DGBE		0.00	0.00	0.00
Dielectric Constant	Target	48.96	48.47	48.25
Conductivity (S/m)	Target	5.35	5.77	5.96

### Device Holder

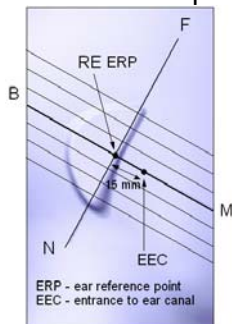

In combination with the SAM phantom, the mounting device enables the rotation of the mounted transmitter in spherical coordinates whereby the rotation point is the ear opening. The devices can easily, accurately, and repeatably be positioned according to the FCC specifications. The device holder can be locked at different phantom locations (left head, right head, and uni-phantom).

## 6. Definition of Reference Points

### Ear Reference Point

Figure 6.2 shows the front, back and side views of the SAM Phantom. The point “M” is the reference point for the center of the mouth, “LE” is the left ear reference point (ERP), and “RE” is the right ERP. The ERPs are 15mm posterior to the entrance to the ear canal (EEC) along the B-M line (Back-Mouth), as shown in Figure 6.1. The plane passing through the two ear canals and M is defined as the Reference Plane. The line N-F (Neck-Front) is perpendicular to the reference plane and passing through the RE (or LE) is called the Reference Pivoting Line (see Figure 6.1). Line B-M is perpendicular to the N-F line. Both N-F and B-M lines are marked on the external phantom shell to facilitate handset positioning [5].

**Figure 6.1 Close-up side view of ERP's**

**Figure 6.2 Front, back and side view of SAM**

### Device Reference Points

Two imaginary lines on the device need to be established: the vertical centerline and the horizontal line. The test device is placed in a normal operating position with the “test device reference point” located along the “vertical centerline” on the front of the device aligned to the “ear reference point” (See Fig. 6.3). The “test device reference point” is then located at the same level as the center of the ear reference point. The test device is positioned so that the “vertical centerline” is bisecting the front surface of the device at it's top and bottom edges, positioning the “ear reference point” on the outer surface of both the left and right head phantoms on the ear reference point [5].

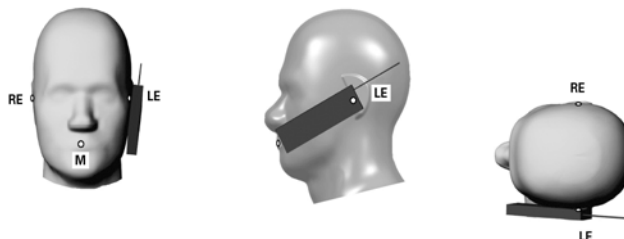

**Figure 6.3 Handset Vertical Center & Horizontal Line Reference Points**

## 7. Test Configuration Positions

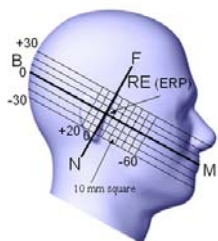

### Positioning for Cheek/Touch [5]

1. Position the device close to the surface of the phantom such that point A is on the (virtual) extension of the line passing through points RE and LE on the phantom (see Figure 7.1), such that the plane defined by the vertical center line and the horizontal line of the device is approximately parallel to the sagittal plane of the phantom.

**Figure 7.1 Front, Side and Top View of Cheek/Touch Position**

2. Translate the device towards the phantom along the line passing through RE and LE until the device touches the ear.
3. While maintaining the device in this plane, rotate it around the LE-RE line until the vertical centerline is in the plane normal to MB-NF including the line MB (called the reference plane).
4. Rotate the device around the vertical centerline until the device (horizontal line) is symmetrical with respect to the line NF.
5. While maintaining the vertical centerline in the reference plane, keeping point A on the line passing through RE and LE and maintaining the device contact with the ear, rotate the device about the line NF until any point on the device is in contact with a phantom point below the ear (cheek). See Figure 7.2.

**Figure 7.2 Side view w/ relevant markings**

## Positioning for Ear / 15° Tilt [5]

With the test device aligned in the Cheek/Touch Position”:

1. While maintaining the orientation of the device, retracted the device parallel to the reference plane far enough to enable a rotation of the device by 15 degrees.
2. Rotate the device around the horizontal line by 15 degrees.
3. While maintaining the orientation of the device, move the device parallel to the reference plane until any part of the device touches the head. (In this position, point A is located on the line RE-LE). The tilted position is obtained when the contact is on the pinna. If the contact is at any location other than the pinna, the angle of the device shall be reduced. The tilted position is obtained when any part of the device is in contact with the ear as well as a second part of the device is in contact with the head (see Figure 7.3).

**Figure 7.3 Front, Side and Top View of Ear/15° Tilt Position**

## Body Worn Configurations

Body-worn operating configurations are tested with the accessories attached to the device and positioned against a flat phantom in a normal use configuration. A device with a headset output is tested with a headset connected to the device. Body dielectric parameters are used.

Accessories for Body-worn operation configurations are divided into two categories: those that do not contain metallic components and those that do contain metallic components. When multiple accessories that do not contain metallic components are supplied with the device, the device is tested with only the accessory that dictates the closest spacing to the body. Then, when multiple accessories that contain metallic components are supplied with the device, the device is tested with each accessory that contains a unique metallic component. If multiple accessories share an identical metallic component (i.e. the same metallic belt-clip used with different holsters with no other metallic components) only the accessory that dictates the closest spacing to the body is tested.

Body-worn accessories may not always be supplied or available as options for some devices intended to be authorized for body-worn use. In this case, a test configuration where a separation distance between the back of the device and the flat phantom is used. All test position spacings are documented.

Transmitters that are designed to operate in front of a person's face, as in push-to-talk configurations, are tested for SAR compliance with the front of the device positioned to face the flat phantom. For devices that are carried next to the body such as a shoulder, waist or chest-worn transmitters, SAR compliance is tested with the accessory(ies), including headsets and microphones, attached to the device and positioned against a flat phantom in a normal use configuration.

In all cases SAR measurements are performed to investigate the worst-case positioning. Worst-case positioning is then documented and used to perform Body SAR testing.

In order for users to be aware of the body-worn operating requirements for meeting RF exposure compliance, operating instructions and cautions statements are included in the user's manual.

## 8. ANSI/IEEE C95.1 – 1999 RF Exposure Limits [2]

### Uncontrolled Environment

Uncontrolled Environments are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure. The general population/uncontrolled exposure limits are applicable to situations in which the general public may be exposed or in which persons who are exposed as a consequence of their employment may not be made fully aware of the potential for exposure or cannot exercise control over their exposure. Members of the general public would come under this category when exposure is not employment-related; for example, in the case of a wireless transmitter that exposes persons in its vicinity.

### Controlled Environment

Controlled Environments are defined as locations where there is exposure that may be incurred by persons who are aware of the potential for exposure, (i.e. as a result of employment or occupation). In general, occupational/controlled exposure limits are applicable to situations in which persons are exposed as a consequence of their employment, who have been made fully aware of the potential for exposure and can exercise control over their exposure. This exposure category is also applicable when the exposure is of a transient nature due to incidental passage through a location where the exposure levels may be higher than the general population/uncontrolled limits, but the exposed person is fully aware of the potential for exposure and can exercise control over his or her exposure by leaving the area or by some other appropriate means.

**Table 8.1 Human Exposure Limits**

	UNCONTROLLED ENVIRONMENT General Population (W/kg) or (mW/g)	CONTROLLED ENVIROMENT Professional Population (W/kg) or (mW/g)
SPATIAL PEAK SAR <sup>1</sup> Brain	1.60	8.00
SPATIAL AVERAGE SAR <sup>2</sup> Whole Body	0.08	0.40
SPATIAL PEAK SAR <sup>3</sup> Hands, Feet, Ankles, Wrists	4.00	20.00

<sup>1</sup> The Spatial Peak value of the SAR averaged over any 1 gram of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.

<sup>2</sup> The Spatial Average value of the SAR averaged over the whole body.

<sup>3</sup> The Spatial Peak value of the SAR averaged over any 10 grams of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.

## 9. Measurement Uncertainty

### Exposure Assessment Measurement Uncertainty

Source of Uncertainty	Tolerance Value	Probability Distribution	Divisor	$c_i^{-1}$ (1-g)	$c_i^{-1}$ (10-g)	Standard Uncertainty (1-g) %	Standard Uncertainty (10-g) %
Measurement System							
Probe Calibration	3.5	normal	1	1	1	3.5	3.5
Axial Isotropy	3.7	rectangular	•3	$(1-cp)^{1/2}$	$(1-cp)^{1/2}$	1.5	1.5

Combined Uncertainty (coverage factor=2)		Normal (k=2)				19.1	18.8

## 10. System Validation

### Tissue Verification

**Table 10.1 Measured Tissue Parameters**

		5250 MHz Body		5250 MHz Body		5600 MHz Body	
Date(s)		Sep. 11, 2007		Sep. 12, 2007		Sep. 12, 2007	
Liquid Temperature (°C)	20.0	Target	Measured	Target	Measured	Target	Measured
Dielectric Constant: $\epsilon$		49.19	47.40	49.19	48.93	48.22	48.66
Conductivity: $\sigma$		5.40	5.23	5.40	5.20	5.68	5.62
		5800 MHz Body					
Date(s)		Sep. 12, 2007					
Liquid Temperature (°C)	20.0	Target	Measured				
Dielectric Constant: $\epsilon$		48.53	48.65				
Conductivity: $\sigma$		5.95	5.81				

See Appendix A for data printout.

### Test System Verification

Prior to assessment, the system is verified to the  $\pm 10\%$  of the specifications at the test frequency by using the system kit. Power is extrapolated to 1 watt. (Graphic Plots Attached)

**Table 10.2 System Dipole Validation Target & Measured**

	Test Frequency	Targeted SAR <sub>1g</sub> (W/kg)	Measure SAR <sub>1g</sub> (W/kg)	Deviation (%)
11-Sep-2007	5250 MHz	62.98	60.51	- 3.92
12-Sep-2007	5250 MHz	62.98	62.27	- 1.13
12-Sep-2007	5600 MHz	59.92	64.42	+ 7.51
12-Sep-2007	5800 MHz	58.92	54.35	- 6.62

See Appendix A for data plots.

**Figure 10.1 Dipole Validation Test Setup**

## **11. SAR Test Data Summary**

### **See Measurement Result Data Pages**

See Appendix B for SAR Test Data Plots.  
See Appendix C for SAR Test Setup Photos.

### **Procedures Used To Establish Test Signal**

The device was placed into simulated transmit mode using the manufacturer's test codes. Such test signals offer a consistent means for testing SAR and are recommended for evaluating SAR. When test modes are not available or inappropriate for testing a device, the actual transmission is activated through a base station simulator or similar equipment. See data pages for actual procedure used in measurement.

### **Device Test Condition**

The device is battery operated. Each SAR measurement was taken with a fully charged battery. In order to verify that the device was tested at full power, conducted output power measurements were performed before and after each SAR measurement to confirm the output power unless otherwise noted. If a conducted power deviation of more than 5% occurred, the test was repeated.

The testing was conducted on the front of the device with a 0 cm spacing to the face of the phantom due to the proximity of the antenna. The antenna is less than 5 mm from the front surface of the device. This position resulted in the antenna being the closest to the phantom resulting in the worst case SAR scenario. The testing of the side and back of the device would have moved the antenna more than 2.5 cm from the phantom. Therefore, the side and back of the unit were determined to not be required for testing. The worst case position was tested for all bands. The device has an option for an adult carrying pouch and a pediatric carrying pouch. Both pouches do not contain any metal (See photos in Appendix A); therefore, it was deemed unnecessary to conduct SAR testing with the pouches.

During all test sequences, the ECG cable (REF 008-0522-00) and the SpO<sub>2</sub> cable (REF 008-0961-00) were connected to their respective ports located at the top of the monitor. The cables were routed so they would be horizontal to the device for 6 inches from the top of the device. The remaining leads were then allowed to hang down out of the way of the testing.

The unit was required to be disassembled to measure the conducted power. To insure that the integrity of the device was not compromised, the power measurements were conducted at the completion of all testing. If an ERP deviation of more than 5% occurred, the test was repeated.

All testing was conducted at 25% duty cycle. The SAR value and conducted power was extrapolated to 100% duty cycle.

## 13.1 Conclusion

The SAR measurement indicates that the EUT complies with the RF radiation exposure limits of the FCC. These measurements are taken to simulate the RF effects exposure under worst-case conditions. Precise laboratory measures were taken to assure repeatability of the tests. The tested device complies with the requirements in respect to all parameters subject to the test. The test results and statements relate only to the item(s) tested.

Please note that the absorption and distribution of electromagnetic energy in the body is a very complex phenomena that depends on the mass, shape, and size of the body; the orientation of the body with respect to the field vectors; and, the electrical properties of both the body and the environment. Other variables that may play a substantial role in possible biological effects are those that characterize the environment (e.g. ambient temperature, air velocity, relative humidity, and body insulation) and those that characterize the individual (e.g. age, gender, activity level, debilitation, or disease). Because innumerable factors may interact to determine the specific biological outcome of an exposure to electromagnetic fields, any protection guide shall consider maximal amplification of biological effects as a result of field-body interactions, environmental conditions, and physiological variables. [3]

Model : ALS-D-BB-S-2  
Frequency : 5800.00 MHz  
Max. Transmit Pwr : 0.1 W  
Drift Time : 0 min(s)  
Length : 23.1 mm  
Width : 3.6 mm  
Depth : 20.7 mm  
Antenna Type : Internal  
Orientation : Touch  
Power Drift-Start : 6.863 W/kg  
Power Drift-Finish: 6.935 W/kg  
Power Drift (%) : 1.045

## Phantom Data

Name : APREL-Uni  
Type : Uni-Phantom  
Size (mm) : 280 x 280 x 200  
Serial No. : System Default  
Location : Center  
Description : Uni-Phantom

## Tissue Data

Type : BODY  
Serial No. : 5800  
Frequency : 5800.00 MHz  
Last Calib. Date : 12-Sep-2007  
Temperature : 20.00 °C  
Ambient Temp. : 23.00 °C  
Humidity : 50.00 RH%  
Epsilon : 48.65 F/m  
Sigma : 5.81 S/m  
Density : 1000.00 kg/cu. m

## Probe Data

Name : Probe AL-E3P1 - AL  
Model : E-030  
Type : E-Field Triangle  
Serial No. : AL-E3P1  
Last Calib. Date : 30-Apr-2007  
Frequency : 5800.00 MHz  
Duty Cycle Factor: 1  
Conversion Factor: 14  
Probe Sensitivity: 1.20 1.20 1.20  $\mu\text{V}/(\text{V}/\text{m})^2$   
Compression Point: 95.00 mV  
Offset : 0.56 mm

**Measurement Data**

Crest Factor : 1  
 Scan Type : Complete  
 Tissue Temp. : 20.00 °C  
 Ambient Temp. : 23.00 °C  
 Set-up Date : 12-Sep-2007  
 Set-up Time : 4:10:18 PM  
 Area Scan : 5x5x1 : Measurement x=10mm, y=10mm, z=2mm  
 Zoom Scan : 7x7x16 : Measurement x=4mm, y=4mm, z=2mm

**Other Data**

DUT Position : Touch  
 Separation : 10  
 Channel : Mid

1 gram SAR value : 5.435 W/kg  
 10 gram SAR value : 1.452 W/kg  
 Area Scan Peak SAR : 6.578 W/kg  
 Zoom Scan Peak SAR : 19.415 W/kg

**SAR-Z Axis**  
at Hotspot x:0.35 y:-0.15

## Appendix B – SAR Test Data Plots

**SAR Test Report**

By Operator : Jay  
Measurement Date : 11-Sep-2007  
Starting Time : 11-Sep-2007 06:30:57 PM  
End Time : 11-Sep-2007 06:43:51 PM  
Scanning Time : 774 secs

**Product Data**

Device Name : Welch Allyn  
Serial No. : HD000288  
Type : Other  
Model : 408  
Frequency : 5200.00 MHz  
Max. Transmit Pwr : 0.032 W  
Drift Time : 0 min(s)  
Length : 194 mm  
Width : 88 mm  
Depth : 46 mm  
Antenna Type : Internal  
Orientation : Touch  
Power Drift-Start : 0.143 W/kg  
Power Drift-Finish: 0.143 W/kg  
Power Drift (%) : 0.365

**Phantom Data**

Name : APREL-Uni  
Type : Uni-Phantom  
Size (mm) : 280 x 280 x 200  
Serial No. : System Default  
Location : Center  
Description : Uni-Phantom

**Tissue Data**

Type : BODY  
Serial No. : 5200  
Frequency : 5200.00 MHz  
Last Calib. Date : 11-Sep-2007  
Temperature : 20.00 °C  
Ambient Temp. : 23.00 °C  
Humidity : 50.00 RH%  
Epsilon : 47.40 F/m  
Sigma : 5.23 S/m  
Density : 1000.00 kg/cu. m

**Probe Data**

Name : Probe AL-E3P1 - AL  
Model : E-030  
Type : E-Field Triangle  
Serial No. : AL-E3P1  
Last Calib. Date : 30-Apr-2007  
Frequency : 5200.00 MHz  
Duty Cycle Factor: 0.25  
Conversion Factor: 13  
Probe Sensitivity: 1.20 1.20 1.20  $\mu\text{V}/(\text{V/m})^2$   
Compression Point: 95.00 mV  
Offset : 0.56 mm

**Measurement Data**

Crest Factor : 0.25  
 Scan Type : Complete  
 Tissue Temp. : 20.00 °C  
 Ambient Temp. : 23.00 °C  
 Set-up Date : 11-Sep-2007  
 Set-up Time : 10:51:00 AM  
 Area Scan : 5x5x1 : Measurement x=10mm, y=10mm, z=2mm  
 Zoom Scan : 7x7x16 : Measurement x=4mm, y=4mm, z=2mm

**Other Data**

DUT Position : Touch  
 Separation : 0  
 Channel : Low

1 gram SAR value : 0.130 W/kg  
 10 gram SAR value : 0.076 W/kg  
 Area Scan Peak SAR : 0.138 W/kg  
 Zoom Scan Peak SAR : 0.280 W/kg

## SAR Test Report

By Operator : Jay  
Measurement Date : 11-Sep-2007  
Starting Time : 11-Sep-2007 06:14:16 PM  
End Time : 11-Sep-2007 06:27:08 PM  
Scanning Time : 772 secs

### Product Data

## Appendix D – Probe Calibration Data Sheets

# NCL CALIBRATION LABORATORIES

Calibration File No.: CP-752

Client.: APREL

## CERTIFICATE OF CALIBRATION

It is certified that the equipment identified below has been calibrated in the  
**NCL CALIBRATION LABORATORIES** by qualified personnel following recognized  
procedures and using transfer standards traceable to NRC/NIST.

Equipment: Miniature Isotropic RF Probe 5200 MHz

Manufacturer: APREL Laboratories

Model No.: E-030

Serial No.: AL-E3P1

Calibration in Body Tissue

Calibration Procedure: SSI/DRB-TP-D01-032-E020-V2

Project No: APLB-5200-PC-5264

Calibrated: 29<sup>th</sup> April 2007

Released on: 30<sup>th</sup> April 2007

This Calibration Certificate is Incomplete Unless Accompanied with the Calibration Results Summary

Released By: \_\_\_\_\_

**NCL CALIBRATION LABORATORIES**

SSI-TP-011 Tissue Calibration Procedure

## Conditions

Probe AL-E3P1 was a new probe taken from stock prior to calibration.

**Ambient Temperature of the Laboratory:** 22 °C +/- 0.5°C

**Temperature of the Tissue:** 21 °C +/- 0.5°C

**We the undersigned attest that to the best of our knowledge the calibration of this probe has been accurately conducted and that all information contained within this report has been reviewed for accuracy.**

-----  
**Jesse Hones**

## **Calibration Results Summary**

<b>Probe Type:</b>	E-Field Probe E-030
<b>Serial Number:</b>	AL-E3P1
<b>Frequency:</b>	5200 MHz
<b>Sensor Offset:</b>	0.56 mm
<b>Sensor Length:</b>	2.5 mm
<b>Tip Enclosure:</b>	Ertalyte*
<b>Tip Diameter:</b>	<3 mm
<b>Tip Length:</b>	60 mm
<b>Total Length:</b>	290 mm

\*Resistive to recommended tissue recipes per IEEE-1528

## **Sensitivity in Air**

<b>Channel X:</b>	$1.2 \mu\text{V}/(\text{V}/\text{m})^2$
<b>Channel Y:</b>	$1.2 \mu\text{V}/(\text{V}/\text{m})^2$
<b>Channel Z:</b>	$1.2 \mu\text{V}/(\text{V}/\text{m})^2$
<b>Diode Compression Point:</b>	95 mV

## **Sensitivity in FCC Body Tissue**

**Frequency:** 5200 MHz

**Epsilon:** 48.9 (+/-10%)      **Sigma:** 5.35 S/m (+/-10%)

### **ConvF**

**Channel X:** 13

**Channel Y:** 13

**Channel Z:** 13

Tissue sensitivity values were calculated using the load impedance of the APREL Laboratories Daq-Paq.

## **Boundary Effect:**

Uncertainty resulting from the boundary effect is less than 2% for the distance between the tip of the probe and the tissue boundary, when less than 0.5mm.

## **Spatial Resolution:**

The measured probe tip diameter is less than 3 mm (+/- 0.01 mm) and therefore meets the requirements of SSI/DRB-TP-D01-032 for spatial resolution.

## Receiving Pattern 5200 MHz (Air)

Isotropy Error 5200 MHz (Air)

Isotropicity in Tissue:

0.15 dB

## Dynamic Range

## Video Bandwidth

**Video Bandwidth at 500 Hz**                      1 dB  
**Video Bandwidth at 1.02 KHz:**                3 dB

## **Conversion Factor Uncertainty Assessment**

**Frequency:** 5200 MHz

**Epsilon:** 48.9 (+/-10%)

**Sigma:** 5.35 S/m (+/-10%)

### **ConvF**

**Channel X:** 13 7%(K=2)

**Channel Y:** 13 7%(K=2)

**Channel Z:** 13 7%(K=2)

To minimize the uncertainty calculation all tissue sensitivity values were calculated using a load impedance of 5 MΩ.

### **Boundary Effect:**

For a distance of 0.5 mm the evaluated uncertainty (increase in the probe sensitivity) is less than 2%.

## **Test Equipment**

The test equipment used during Probe Calibration, manufacturer, model number and, current calibration status are listed and located on the main APREL server R:\NCL\Calibration Equipment\Instrument List May 2006.

## RF Exposure Lab, LLC

Calibration File No: CAL.20070501

### CERTIFICATE OF CALIBRATION

It is certified that the equipment identified below has been calibrated at RF Exposure Lab, LLC by qualified personnel following recognized procedures and using transfer standards traceable to NRC/NIST.

#### Validation Dipole

Manufacturer: APREL Laboratories

Part Number: ALS-D-BB-S-2

Frequency: 5.2 GHz to 5.8 GHz

Serial No: 235-00801

Manufactured: 22 May 2005

Calibrated: 23 May 2007

Calibrated By: Signature on File  
Jay Moulton – Technical Manager

Approved By: Signature on File  
Tamara Moulton – Quality Manager

Measurement Uncertainty:

Repeatability:	23%
Tissue Uncertainty:	3.2%
Network Analyzer:	25%

## RF EXPOSURE LAB, LLC

Escondido, CA 92029

Tel: (760) 737-3131  
FAX: (760) 737-9131

## Calibration Results Summary

The following results relate to the Calibrated Dipole and should be used as a quick reference for the user.

### Mechanical Dimensions

**Length:** 23.3 mm  
**Height:** 20.3 mm

### Electrical Specifications

#### 5.2 GHz Body

**SWR:** 1.8749 U  
**Return Loss:** -17.057 dB  
**Impedance:** 54.252  $\Omega$

### System Validation Results

Frequency	1 Gram	10 Gram
5.2 GHz	62.98	15.44

#### 5.6 GHz Body

**SWR:** 1.2178 U  
**Return Loss:** -18.513 dB  
**Impedance:** 45.365  $\Omega$

### System Validation Results

Frequency	1 Gram	10 Gram
5.6 GHz	59.92	15.30

#### 5.8 GHz Body

**SWR:** 1.8551 U  
**Return Loss:** -10.237 dB  
**Impedance:** 45.014  $\Omega$

### System Validation Results

Frequency	1 Gram	10 Gram
5.8 GHz	58.92	15.05

## 5.2 GHz Body Measurement Conditions

The measurements were performed in the Uni-Phantom filled with body simulating liquid of the following electrical parameters at 5.2 GHz:

Relative Dielectricity	49.19	$\pm 5\%$
Conductivity	5.40 mho/m	$\pm 5\%$

The APREL Laboratories ALSAS system with a dosimetric E-field probe E-030 (SN:AL-E3P1, Conversion factor 13.0 at 5.2 GHz) was used for the measurements.

The dipole was mounted so that the dipole feed point was positioned below the center marking of the flat phantom and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10mm from the dipole center to the solution surface.

The coarse grid with a grid spacing of 10mm was aligned with the dipole. The 7x7x7 fine cube was chosen for cube integration. The dipole input power (forward power) was 100mW  $\pm 3\%$ . The results are normalized to 1W input power.

The laboratories environmental conditions were as follows during the calibration sequence.

Ambient Temperature of the Laboratory:	23 °C $\pm 1.0$ °C
Temperature of the Tissue:	20 °C $\pm 1.0$ °C
Relative Humidity:	52%

## SAR Measurement

Standard SAR measurements were performed according to the measurement conditions described above. The results have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR values measured with the dosimetric probe E-030 SN:AL-E3P1 and applying the advanced extrapolation are:

Averaged over 1 cm<sup>3</sup> (1 g) of tissue: 62.98 mW/g  $\pm$  19.1% (k=2)<sup>1</sup>

Averaged over 10 cm<sup>3</sup> (10 g) of tissue: 15.44 mW/g  $\pm$  18.8% (k=2)<sup>1</sup>

1 gram SAR value : 6.298 W/kg  
 10 gram SAR value : 1.544 W/kg  
 Area Scan Peak SAR : 8.173 W/kg  
 Zoom Scan Peak SAR : 21.817 W/kg

<sup>1</sup> validation uncertainty

## 5.6 GHz Body Measurement Conditions

The measurements were performed in the Uni-Phantom filled with body simulating liquid of the following electrical parameters at 5.6 GHz:

Relative Dielectricity	48.22	$\pm 5\%$
Conductivity	5.68 mho/m	$\pm 5\%$

The APREL Laboratories ALSAS system with a dosimetric E-field probe E-030 (SN:AL-E3P1, Conversion factor 13.5 at 5.6 GHz) was used for the measurements.

The dipole was mounted so that the dipole feed point was positioned below the center marking of the flat phantom and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10mm from the dipole center to the solution surface.

The coarse grid with a grid spacing of 10mm was aligned with the dipole. The 7x7x7 fine cube was chosen for cube integration. The dipole input power (forward power) was 100mW  $\pm 3\%$ . The results are normalized to 1W input power.

The laboratories environmental conditions were as follows during the calibration sequence.

Ambient Temperature of the Laboratory:	23 °C $\pm 1.0$ °C
Temperature of the Tissue:	20 °C $\pm 1.0$ °C
Relative Humidity:	52%

## SAR Measurement

Standard SAR measurements were performed according to the measurement conditions described above. The results have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR values measured with the dosimetric probe E-030 SN:AL-E3P1 and applying the advanced extrapolation are:

Averaged over 1 cm<sup>3</sup> (1 g) of tissue: 59.92 mW/g  $\pm$  19.1% (k=2)<sup>1</sup>

Averaged over 10 cm<sup>3</sup> (10 g) of tissue: 15.30 mW/g  $\pm$  18.8% (k=2)<sup>1</sup>

1 gram SAR value : 5.992 W/kg  
 10 gram SAR value : 1.530 W/kg  
 Area Scan Peak SAR : 7.693 W/kg  
 Zoom Scan Peak SAR : 19.415 W/kg

<sup>1</sup> validation uncertainty

## 5.8 GHz Body Measurement Conditions

The measurements were performed in the Uni-Phantom filled with body simulating liquid of the following electrical parameters at 5.8 GHz:

Relative Dielectricity	48.53	$\pm 5\%$
Conductivity	5.95 mho/m	$\pm 5\%$

The APREL Laboratories ALSAS system with a dosimetric E-field probe E-030 (SN:AL-E3P1, Conversion factor 14.0 at 5.8 GHz) was used for the measurements.

The dipole was mounted so that the dipole feed point was positioned below the center marking of the flat phantom and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10mm from the dipole center to the solution surface.

The coarse grid with a grid spacing of 10mm was aligned with the dipole. The 7x7x7 fine cube was chosen for cube integration. The dipole input power (forward power) was 100mW  $\pm 3\%$ . The results are normalized to 1W input power.

The laboratories environmental conditions were as follows during the calibration sequence.

Ambient Temperature of the Laboratory:	23 °C $\pm 1.0$ °C
Temperature of the Tissue:	20 °C $\pm 1.0$ °C
Relative Humidity:	52%

## SAR Measurement

Standard SAR measurements were performed according to the measurement conditions described above. The results have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR values measured with the dosimetric probe E-030 SN:AL-E3P1 and applying the advanced extrapolation are:

Averaged over 1 cm<sup>3</sup> (1 g) of tissue: 58.92 mW/g  $\pm$  19.1% (k=2)<sup>1</sup>

Averaged over 10 cm<sup>3</sup> (10 g) of tissue: 15.05 mW/g  $\pm$  18.8% (k=2)<sup>1</sup>

1 gram SAR value : 5.892 W/kg  
 10 gram SAR value : 1.505 W/kg  
 Area Scan Peak SAR : 7.388 W/kg  
 Zoom Scan Peak SAR : 19.315 W/kg

## Dipole Impedance and Return Loss

The impedance was measured at the SMA connector with a network analyzer. The dipole was positioned at the flat phantom sections according to measurement conditions stated above during impedance measurements.

Test	Result – 5.2 GHz	Result – 5.6 GHz	Result – 5.8 GHz
S11 R/L	-17.057 dB	-18.513 dB	-10.237 dB
SWR	1.8749 U	1.2178 U	1.8551 U
Impedance	54.252 $\Omega$	45.365 $\Omega$	45.014 $\Omega$

The following graphs are the results as displayed on the Vector Network Analyzer.

### S11 Parameter Return Loss

## NCL CALIBRATION LABORATORIES

Calibration File No.: RFE-273

# CERTIFICATE OF CALIBRATION

It is certified that the equipment identified below has been calibrated in the  
**NCL CALIBRATION LABORATORIES** by qualified personnel following recognized  
procedures and using transfer standards traceable to National Standards.

Thickness of the UniPhantom is 2 mm  $\pm$  10%  
Pinna thickness is 6 mm  $\pm$  10%

Resolution:	0.01 mm	Calibrated to:	0.0 mm
Stability:	OK	Accuracy:	< 0.1 mm

Calibrated By: Karen K. Feb 17/04.
