3 EUT description

3.1 General description

A subscriber premises radio, SPR 5.8 GHz TDD, is a part of a broadband fixed cellular wireless access system WipLL. The system provides a radio link between an end-user (a subscriber) and a network itself to give high-speed data access. The EUT is an outdoor unit comprising two modes of operation:
1) frequency hopping:
   OR
2) hybrid system (digital modulation with frequency hopping) .

The transceiver operates in 5726 MHz to 5849 MHz range and is equipped with an 16 dBi gain flat plane internal antenna.

The SPR is connected to a subscriber data adapter (SDA), which provides also 48 V DC power.

3.2 EUT test configuration

EUT operating frequencies generated by clocks and oscillators are provided in Table 3.2.1 and system/test configuration is shown in Figures 3.2.1, 3.2.2.

4.5 Out of band conducted emissions test according to §15.247(c)

METHOD OF MEASUREMENTS: ANSI 63.4 §13.1.5
DATE: June 15 and July 8, 2003
RELATIVE HUMIDITY: 44 %
AMBIENT TEMPERATURE: 23 °C
AIR PRESSURE: 1012 hPa
RATED RF OUTPUT POWER: 20 dBm (hopping), 18 dBm (hybrid)
OPERATING FREQUENCY RANGE: 5725-5850 MHz
MODULATION TECHNIQUE: FHSS/hybrid
FREQUENCY RANGE: 9 kHz – 40 GHz

Hopping mode

Spurious emission measurements were performed at the lowest (5.726 GHz), the highest (5.849 GHz) and one of the middle (5.800 GHz) frequencies. Test results are shown in Plots A30 to A57.
No spurious emissions were found throughout the testing. No effect of the data rate was observed (Plots A53 to A55) therefore only 3 Mbit/s rate was used for measurements.

Hybrid mode

The output power was decreased by 3 dB for this mode. Spurious emission testing in hopping mode at 21 dBm output power was considered the worst case, therefore the measurements in hybrid mode in the whole range were not performed, as the hardware is exactly the same. Emissions at the lower band edge (see Plots A62 to A65) and at the higher band edge (see Plots A58 to A61) were examined.

TEST EQUIPMENT USED:

HL 1424	HL 1650	HL 1651	HL 2254			

LIMIT

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power.

TEST PROCEDURE

The EUT RF output was connected via attenuator to spectrum analyzer, which settings are shown in the plots. Spectrum analyzer readings were corrected for external attenuation and cable loss.

LIMIT

The peak power spectral density shall be not greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

TEST PROCEDURE

The EUT RF output was connected via attenuator to the spectrum analyzer; the settings are shown in the plots. Spectrum analyzer readings were corrected for external attenuation and cable loss. The measurements were performed in continuous transmission mode of operation for carrier (channel) frequency modulated with PRBS at low and high edges and at the middle of the range.

The position of the EUT cables was varied to determine maximum emission level.
