1.3 Limits and Reservations

The test results in this report apply only to the particular Device Under Test (DUT) and component Implementations Under Test (IUTs) declared in this test report. The results and associated conclusions apply only to the DUT while operating in the configuration and modes described herein. The test data contained herein is intended to be used by a TCB for the purpose of achieving FCC Part 15, FCC Part 90, and Industry Canada RSS-210e certification of the DUT.

This test report is a re-issue of Test Report Number FCCIR-ZHONE-09-19-07 and supersedes that report. The purpose of the revision was to extend the scope of the radiated emissions to include the limit as required by Part 90, FCC Rules.

This test report shall not be reproduced except in full without the written permission of Jabil Circuit or its assigns.

Jabil Circuit owns the copyright in respect of this report.

2 GENERAL INFORMATION

2.1 Product Description

The SkyZhone-1624 access point is a dual radio, line-powered carrier class outdoor Wi-Fi access point with 22 Mbps symmetric DSL backhaul to every unit. The SkyZhone-1624 supports a variety of applications including VoIP, internet access, mobile video, and enterprise VPNs optimized for citywide Wi-Fi deployments by telephone companies. SkyZhone-1624 enables telephone companies to deploy a more reliable, lower latency, higher speed and lower cost network than traditional mesh Wi-Fi solutions. For 802.11b/g operation, the unit includes three 5 dBi antennas configured in a 2X3 fashion, Comet Part Number CFA-245W. Antennas with lower gain may also be used. For operation in the 4940 – 4990 MHz Public Safety Radio band, the product uses two 5.3 dBi antennas, Comet Part Number SF-D49N W-SR. Antennas with lower gain may also be used. The antennas are configured in a 2X2 MIMO fashion with power split between the two antennas.

The SkyZhone-1624 combines the functionality of two previously certified single radio versions, the SkyZhone-1224 and SkyZhone-1424. These have been certified under FCC ID Numbers: PJZSZ1224 and PJZSZ1424 respectively.

2.2 Interface Cable Details

Interface cables used in the system are as follows:

Qty	Length	Cable Description	
1	30'	Shielded CAT5 4 twisted pairs SHDSL cable	
1	30'	Shielded CAT5 4 twisted pairs Ethernet cable	

2.3 Peripheral Devices

The following test support devices were used in the test set-up.

Qty	Description	Manufacturer/Model	Serial Number
1	PC	Gateway GP6-400	0014300762

2.4 Test Methodology

A radiated emission testing was performed according to ANSI C63.4-2003, the procedure referenced by Part 15, FCC Rules. Radiated emissions tests were performed at an antenna to EUT distance of 3 meters. The measurement of digital transmission systems operating under Section 15.247 was performed in accordance with KDB Publication Number 558074 issued by the FCC's OET.

FCC Test Report	FCC ID: PJZSZ1624 IC: 3691A-SZ1624	Page: 6 of 36

2.5 Test Facility

The 3-meter semi-anechoic test chamber and measurement facility used to collect the radiated and conducted data is located at 8545 126th Avenue N., Largo FL 33773. This laboratory is NVLAP Accredited (NVLAP Lab Code 200125-0). The site has also been registered with Industry Canada, 2146A-1.

2.6 Deviations

No deviations were exercised during the course of the testing.

3 SYSTEM TEST CONFIGURATION

3.1 Justification

The scope of this test was limited to radiated emissions as all other technical requirements were tested and judged compliant as part of the certification efforts for the SkyZhone-1224 and SkyZhone-1424 single radio models. The two radios are completely independent and do not affect each other's conformance with Part 15 and Part 90, FCC Rules. This test report addresses the possible concern that the two radios operating simultaneously could affect radiated emissions.

The DUT was tested using specialized test modes used to stress the DUT maximizing its emissions.

One test mode enabled the DUT to output its maximum power spectral density and bandwidth on each of its 4 SHDSL lines without the need for companion STU-C equipment. These lines were terminated in a 135 Ω differential resistive load with lines 1 and 2 fed by the requisite dc line power. The SHDSL cable was routed down to the center of the turn table and beneath the ground plane on out to a dc supply source located outside the test chamber.

The Power over Ethernet (POE) cable was also routed down to the center of the turn table beneath the ground plane. Its 10/100 Base-T pairs were connected to a host PC located outside the test chamber. The PC was conditioned to ping the IP address of the DUT continuously. The cable's 48 V and return pair was terminated in a resistive load providing the rated load of 5 watts.

The other test modes allowed the radios to transmit in both bands at their maximum duty cycle and allowed the 802.11 mode (b/g), line rate, channel, and power level to be set.

All measurements were performed with the DUT powered by a maximum line voltage of ±140 VDC.

Although not required, the radiated emissions test for digital circuitry was performed with the radios on. Performing the test in this manner also confirmed that the radios did not cause excessive emissions levels in the restricted frequency bands below 1000 MHz.

The DUT has a console port used exclusively by service personnel for configuration. Since this is a temporary cable and not part of the user's installation, this cable was not connected for radiated emissions tests.

4 CONDUCTED EMISSIONS DATA

Reference: 47 C.F.R. § 15.207 (a)

(a) Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits in the following table, as measured using a 50 μH/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Table 4-1

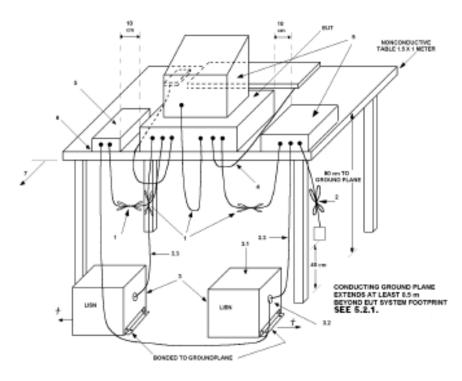

Frequency of Emission (MHz)	Conducted Limit (dBuV)		
	Quasi-peak	Average	
0.15-0.5	66 to 56 *	56 to 46 *	
0.5-5	56	46	
5-30	60	50	

^{*} Decreases with the logarithm of the frequency.

4.1 Test Procedure

The test is performed in accordance with ANSI C63.4-2003 § 7. The test setup is consistent with ANSI C63.4-2003 Figure 10a below. The test was performed in a semi-anechoic chamber. As such, the optional vertical conducting plane is not used.

LEGEND:

- Interconnecting cables that hang closer than 40 cm to the groundplane shall be folded back and forth in the center forming a bundle 30 to 40 cm long (see 6.1.4 and 11.2.4).
- I/O cables that are not connected to a peripheral shall be bundled in the center. The end of the
 cable may be terminated, if required, using the correct terminating impedance. The overall
 length shall not exceed 1 m (see 6.1.4).
- EUT connected to one LISN. Unused LISN measuring port connectors shall be terminated in 50 Ω. LISN can be placed on top of, or immediately beneath, reference groundplane (see 5.2.3 and 7.2.1).
 - 3.1) All other equipment powered from additional LISN(s).
 - 3.2) Multiple outlet strip can be used for multiple power cords of non-EUT equipment.
 - 3.3) LISN at least 80 cm from nearest part of EUT chassis.
- Cables of hand-operated devices, such as keyboards, mice, etc., shall be placed as for normal use (See 6.2.1.3 and 11.2.4).
- 5) Non-EUT components of EUT system being tested (see also Figure 13).
- Rear of EUT, including peripherals, shall all be aligned and flush with rear of tabletop (see 6.2.1.1 and 6.2.1.2).
- Rear of tabletop shall be 40 cm removed from a vertical conducting plane that is bonded to the groundplane (see 5.2.2 for options).

Figure 10a-Test arrangement for conducted emissions

Conducted emissions measurements are first made using a peak detector and average detector simultaneously. The receiver then performs the final measurements using a quasi-peak detector for comparison with the quasi-peak limit and an average detector for comparison with the average limit.

Jabil Circuit, Inc.	Test Report ID: FCCIR-ZHONE-09-19-07b

FCC Test Report	FCC ID: PJZSZ1624 IC: 3691A-SZ1624	Page: 11 of 36

4.2 Measured Data

Compliance Verdict: None

As the DUT was not ac powered, the conducted emissions test was not applicable. The DUT is dc (span) powered from the SHDSL telephone lines.

4.3 Conducted Emissions Test Instrumentation

Туре	Manufacturer/ Model No.	Serial Number
EMI Receiver	Rohde & Schwarz ESCS 30	825788/002
LISN	Rohde & Schwarz ESH3-Z5	840730/005

Calibration and Traceability: All measuring and test equipment are calibrated every 12 months and are traceable to the National Institute for Standards and Technology (NIST) and Methods.

4.4 Conducted Emissions Photographs

No photos were taken as the test was not performed.

5 RADIATED EMISSIONS DATA

Reference: 47 C.F.R. § 15.209

(a) Except as provided elsewhere in this Subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Table 5-1

Frequency of Emission (MHz)	Field Strength (3 m) (microvolts/meter)	Field Strength (3 m) (dBµV/m)
0.009 - 0.490	2400/F (kHz) @ 300 m	300
0.490 - 1.705	24000/F (kHz) @ 30 m	30
1.705 – 30.0	30 @ 30 m	30
30 - 88	100**	40.0
88 - 216	150**	43.5
216 - 960	200**	46.0
Above 960	500	54.0

^{**} Except as provided in paragraph (g), fundamental emissions from intentional radiators operating under this Section shall not be located in the frequency bands 54-72 MHz, 76-88 MHz, 174-216 MHz or 470-806 MHz. However, operation within these frequency bands is permitted under other sections of this Part, e.g., Sections 15.231 and 15.241.

Jabil Circuit, Inc.Test Report ID: FCCIR-ZHONE-09-19-07bSt. Petersburg, FLTitle: SkyZhone-1624 FCC Part 15 & 90 Test ResultsFCC Test ReportFCC ID: PJZSZ1624IC: 3691A-SZ1624Page: 13 of 36

Reference: 47 C.F.R. § 15.205

(a) Except as shown in paragraph (d) of this section, only spurious emissions are permitted in any of the frequency bands listed below:

Table 5-2

13.36 - 13.41			

⁽b) Except as provided in paragraphs (d) and (e), the field strength of emissions appearing within these frequency bands shall not exceed the limits shown in Section 15.209. At frequencies equal to or less than 1000 MHz, compliance with the limits in Section 15.209 shall be demonstrated using measurement instrumentation employing a CISPR quasi-peak detector. Above 1000 MHz, compliance with the emission limits in Section 15.209 shall be demonstrated based on the average value of the measured emissions. The provisions in Section 15.35 apply to these measurements.

FCC Test Report	FCC ID: PJZSZ1624 IC: 3691A-SZ1624 Page: 14 of 36

5.1 Test Procedure

The test was performed in accordance with ANSI C63.4-2003 § 8. The test setup was consistent with ANSI C63.4-2003 Figure 11a below. The test was performed in a semi-anechoic chamber.

LEGEND:

- Interconnecting cables that hang closer than 40 cm to the groundplane shall be folded back and forth
 in the center, forming a bundle 30 to 40 cm long (see 6.1.4 and 11.2.4).
- 2) I/O cables that are not connected to a peripheral shall be bundled in the center. The end of the cable may be terminated if required using the correct terminating impedance. The total length shall not exceed 1 m (see 6.1.4).
- 3) If LISNs are kept in the test setup for radiated emissions, it is preferred that they be installed under the groundplane with the receptacle flush with the groundplane (see 6.1.4).
- Cables of hand-operated devices, such as keyboards, mice, etc., shall be placed as for normal use (see 6.2.1.3 and 11.2.4).
- 5) Non-EUT components of EUT system being tested (see also Figure 13).
- 6) Rear of EUT, including peripherals, shall all be aligned and flush with rear of tabletop (see 6.2.1.1 and 6.2.1.2).
- 7) No vertical conducting plane used (see 5.2.2).
- 8) Power cords drape to the floor and are routed over to receptacle (see 6.1.4).

Figure 11a—Test arrangement for radiated emissions tabletop equipment

The following data lists the significant emission frequencies, amplitude levels (including cable correction and antenna factors), plus the limit. The frequency range investigated was 30 MHz to 1 GHz. The highest frequency to which the DUT must be measured for digital circuitry is 1 GHz as determined by the calculation of 5 times the highest frequency to which the DUT operates or tunes. The six highest emissions within 20 dB of the limit were recorded. Additional radiated emissions were performed from 1 to 15 GHz to examine the DUT's spurious emissions in the restricted bands.

FCC Test Report	FCC ID: PJZSZ1624 IC: 3691A-SZ1624 Page: 15 of 36

5.2 Test Data

Compliance Verdict: PASS

Figure 5.2-1 below shows a composite graph of the radiated emissions levels from 30 to 1000 MHz measured with a peak detector in both vertical and horizontal antenna polarity at turntable angles of 0, 90, 180, and 270 degrees and an antenna height of 1, 2.5, and 4 meters. Rotating the turntable and adjusting the antenna elevation and polarity maximized the final quasi-peak measurements, denoted by the diamonds. In the 30 to 1000 MHz frequency range, the final measurement detector was quasi-peak; the measurement bandwidth was 120 kHz. Table 5.2-1 shows the six highest measured results within 20 dB of the limit for the 30 to 1000 MHz frequency range.

For measurements taken above 1 GHz, the final measurement detector was average; the measurement bandwidth was 1 MHz. Figures 5.2-2 through 5.2-6 show the maximum (peak hold) radiated emissions from 1 to 15 GHz. These plots include measurements at all turntable angles and an antenna height of 1, 2.5, and 4 meters showing the emissions relative to the restricted band limits. These measurements were made with the DUT transmitting in 802.11g mode (Channel 6) in the highest transmit power mode and the 4980 MHz channel also at the highest transmit power as limited by Part 90, FCC Rules. At frequencies above 2.49 GHz, a 2.4 to 2.5 GHz notch filter was used at the input of the preamplifier to prevent the preamplifier from being over driven. This improved measurement sensitivity.

Preliminary measurements showed that the 802.11b and 802.11g lowest data rates resulted in the highest peak power and slightly greatly bandwidth relative to the higher data rates. For this reason, all measurements in this report were made with the DUT operating at its lowest data rate. Preliminary measurements were made in both 802.11b and 802.11g modes with the final data reported in 802.11g mode. Also, preliminary measurements were made using a peak detector in the restricted bands above 1 GHz however these emission levels were considerably below the peak limit.

5.3 Test Instrumentation Used, Radiated Measurement

Туре	Manufacturer/ Model No.	Serial Number
EMI Receiver	Rohde & Schwarz ESCS 30	825788/002
Spectrum Analyzer	Agilent E7405A	MY42000055
Preamplifier	Com-Power PA-122	181925
Notch Filter	Micro-tronics BRM50702-01	023
Antenna	Chase EMC CBL6112B	2579
Antenna	EMCO Horn Model 3115	9002-3393

Calibration and Traceability: All measuring and test equipment are calibrated every 12 months and are traceable to the National Institute for Standards and Technology (NIST) and Methods.

5.4 Field Strength Calculation

The field strength is calculated by adding the antenna correction factor and cable loss and subtracting the amplifier gain (if any) from the measured reading.

The Rohde & Schwarz Model ESCS30 receiver and Agilent E7405A spectrum analyzer have the capability of automatically performing the field strength calculations. The amplitude level displayed on the receiver or analyzer represents the total measured field strength. This level is directly compared to the appropriate FCC limit to determine the actual margin of the DUT.

6 PART 90 RADIATED SPURIOUS EMISSIONS

Reference: 47 C.F.R. § 90.210

Except as indicated elsewhere in this part, transmitters used in the radio services governed by this part must comply with the emission masks outlined in this section. Unless otherwise stated, per paragraphs (d)(4), (e)(4), and (m) of this section, measurements of emission power can be expressed in either peak or average values provided that emission powers are expressed with the same parameters used to specify the unmodulated transmitter carrier power. For transmitters that do not produce a full power unmodulated carrier, reference to the unmodulated transmitter carrier power refers to the total power contained in the channel bandwidth. Unless indicated elsewhere in this part, the table in this section specifies the emission masks for equipment operating in the frequency bands governed under this part.

Applicable Emission Masks

Frequency band (MHz)	Mask for equipment with Audio low pass filter	Mask for equipment without audio low pass filter
4940–4990 MHz	L or M	L or M.

- (I) Emission Mask L. For low power transmitters (20 dBm or less) operating in the 4940–4990 MHz frequency band, the power spectral density of the emissions must be attenuated below the output power of the transmitter as follows:
- (1) On any frequency removed from the assigned frequency between 0–45% of the authorized bandwidth (BW): 0 dB.
- (2) On any frequency removed from the assigned frequency between 45–50% of the authorized bandwidth: 219 log (% of (BW)/45) dB.
- (3) On any frequency removed from the assigned frequency between 50–55% of the authorized bandwidth: 10 + 242 log (% of (BW)/50) dB
- (4) On any frequency removed from the assigned frequency between 55–100% of the authorized bandwidth: 20 + 31 log (% of (BW)/55) dB attenuation.
- (5) On any frequency removed from the assigned frequency between 100–150% of the authorized bandwidth: 28 + 68 log (% of (BW)/100) dB attenuation.
- (6) On any frequency removed from the assigned frequency above 150% of the authorized bandwidth: 40 dB.1
- (7) The zero dB reference is measured relative to the highest average power of the fundamental emission measured across the designated channel bandwidth using a resolution bandwidth of at least one percent of the occupied bandwidth of the fundamental emission and a video bandwidth of 30 kHz. The power spectral density is the power measured within the resolution bandwidth of the measurement device divided by the resolution bandwidth of the measurement device. Emission levels are also based on the use of measurement instrumentation employing a resolution bandwidth of at least one percent of the occupied bandwidth.
- (m) Emission Mask M. For high power transmitters (greater that 20 dBm) operating in the 4940–4990 MHz frequency band, the power spectral density of the emissions must be attenuated below the output power of the transmitter as follows:
- (1) On any frequency removed from the assigned frequency between 0–45% of the authorized bandwidth (BW): 0 dB.
- (2) On any frequency removed from the assigned frequency between 45–50% of the authorized bandwidth: 568 log (% of (BW)/45) dB.
- (3) On any frequency removed from the assigned frequency between 50–55% of the authorized bandwidth: 26 + 145 log (% of BW/50) dB

¹ Limit changed from 50 dB to 40 dB as detailed in a March 2006 presentation to the TCB by Steven Dayhoff of the FCC's Equipment Authorization Branch, "Licensed Devices - Recent Rule Interpretations."

FCC Test Report	FCC ID: PJZSZ1624 IC: 3691A-SZ1624 Page: 27 of 36

- (4) On any frequency removed from the assigned frequency between 55–100% of the authorized bandwidth: 32 + 31 log (% of (BW)/55) dB
- (5) On any frequency removed from the assigned frequency between 100–150% of the authorized bandwidth: 40 + 57 log (% of (BW)/100) dB.
- (6) On any frequency removed from the assigned frequency between above 150% of the authorized bandwidth: 50 dB or 55 + 10 log (P) dB, whichever is the lesser attenuation.
- (7) The zero dB reference is measured relative to the highest average power of the fundamental emission measured across the designated channel bandwidth using a resolution bandwidth of at least one percent of the occupied bandwidth of the fundamental emission and a video bandwidth of 30 kHz. The power spectral density is the power measured within the resolution bandwidth of the measurement device divided by the resolution bandwidth of the measurement device. Emission levels are also based on the use of measurement instrumentation employing a resolution bandwidth of at least one percent of the occupied bandwidth.

Note to paragraph m: Low power devices may as an option, comply with paragraph (m).

Reference: 47 C.F.R. § 2.1053

§ 2.1053 Measurements required: Field strength of spurious radiation.

- (a) Measurements shall be made to detect spurious emissions that may be radiated directly from the cabinet, control circuits, power leads, or intermediate circuit elements under normal conditions of installation and operation. Curves or equivalent data shall be supplied showing the magnitude of each harmonic and other spurious emission. For this test, single sideband, independent sideband, and controlled carrier transmitters shall be modulated under the conditions specified in paragraph (c) of § 2.1049, as appropriate. For equipment operating on frequencies below 890 MHz, an open field test is normally required, with the measuring instrument antenna located in the far-field at all test frequencies. In the event it is either impractical or impossible to make open field measurements (e.g. a broadcast transmitter installed in a building) measurements will be accepted of the equipment as installed. Such measurements must be accompanied by a description of the site where the measurements were made showing the location of any possible source of reflections which might distort the field strength measurements. Information submitted shall include the relative radiated power of each spurious emission with reference to the rated power output of the transmitter, assuming all emissions are radiated from halfwave dipole antennas.
- (b) The measurements specified in paragraph (a) of this section shall be made for the following equipment:
- (1) Those in which the spurious emissions are required to be 60 dB or more below the mean power of the transmitter.
- (2) All equipment operating on frequencies higher than 25 MHz.
- (3) All equipment where the antenna is an integral part of, and attached directly to the transmitter.
- (4) Other types of equipment as required, when deemed necessary by the Commission.

FCC Test Report	FCC ID: PJZSZ1624 IC: 3691A-SZ1624 Page: 28 of 36

6.1 Test Procedure

The test was performed as described in Section 5.1 of this test report. The frequency range investigated was 1 to 15 GHz based upon the conducted power measurements at the antenna port.

6.2 Test Data

Compliance Verdict: PASS

The radiated emissions limit was derived from 47 C.F.R. § 90.210. The following paragraphs describe how that limit was determined.

In accordance with 47 C.F.R. § 90.210, the DUT's out-of-band emissions must be attenuated by at least 50 dB relative to the fundamental. The conducted emissions mask test results from the Part 90 test report, (Test Report Number FCC90-ZHONE-09-11-07d) showed compliance. An equivalent radiated emissions limit was calculated based upon the calculated field strength using the measured average signal power of the DUT using the formula below:

$$E = \sqrt{\frac{30xGxP}{R}}$$

Where:

G = Power Gain of Antenna

P = Transmitter Power Output in Watts

R = Distance from Radiator at which field intensity is measured.

The total average power delivered to both antennas was 23.69 dBm or 0.234 watts.

The antenna gain was 5.3 dBi.

The distance from the DUT to the receiving antenna was 3 m.

The calculated field strength of the fundamental signal was 3.52 V/m or 130.9 dBµV/m.

The out-of-band field strength must be 50 dB down from the fundamental for a field strength limit of $80.9 \, dB\mu V/m$.

Radiated emissions data in Section 5.2 of this report showed that the DUT's radiated emissions levels met the generally more restrictive Part 15 limits whilst the DUT's radios operated simultaneously in the 2400-2483.5 MHz band and 4940-4990 MHz band. The only emissions that exceeded the Part 90 limit, calculated above, was the fundamental emissions associated with these bands as authorized by § 15.247 and § 90.210. Reference Figures 5.2.2 through 5.2.6; the harmonics and other spurious emissions were below the calculated limit of $80.9 \ dB\mu V/m$.

7 LABELING AND USER'S GUIDE REQUIREMENTS

7.1 FCC Label Statement

The FCC compliance label shall include the following information:

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

The FCC identifier or the unique identifier, as appropriate, must be displayed on the device.

The FCC id number will be: PJZSZ1624.

The Industry Canada id number will be: 3619A-SZ1624.

Figure 7.1-1 below shows a drawing of the label.

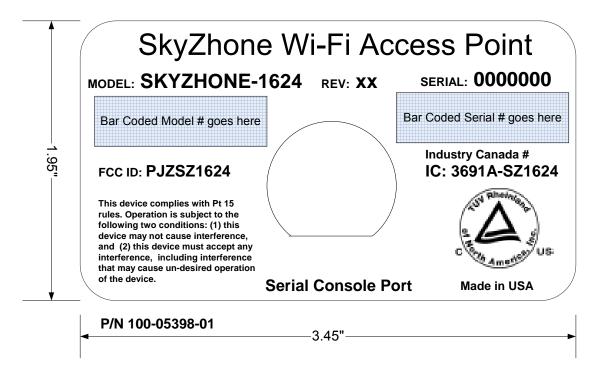

Figure 7.1-1 Sample Label

7.2 Instruction Manual Statements

The instruction manual must contain the following statements:

- Changes or modifications not expressly approved by the responsible party could void the user's authority to operate the equipment.
- The supplied shielded cables must be used to ensure compliance with Part 15, FCC Rules.
- This device may only be used with approved antennas that are shipped with the unit and installed per installation instructions. The use of any other antennas will invalidate the unit's FCC Part 15 certification.
- This device has been designed to operate with the antennas listed below, and having a maximum gain of 5 dBi. Antennas not included in this list (Comet Part Number CFA-245W) or having a gain greater than 5 dBi are strictly prohibited for use with this device. The required antenna impedance is 50 ohms.
- To reduce potential radio interference to other users, the antenna type and its gain should be so chosen that the equivalent isotropically radiated power (e.i.r.p.) is not more than that permitted for successful communication. Operating the device with the supplied antennas will ensure that this requirement is met.
- Operation is subject to the following two conditions: (1) this device may not cause interference, and
 (2) this device must accept any interference, including interference that may cause undesired operation of the device.

TERMS and CONDITIONS

ARTICLE 1 - Services, Jabil Circuit will:

- 1.1 Act for Client in a professional manner, using the degree of care and skill ordinarily exercised by and consistent with the standards of the profession.
- 1.2 Provide only those services that lie within the technical and professional area of expertise and capability of the Lab.
- 1.3 Perform all technical services in accordance with accepted laboratory test principles and practices.
- 1.4 Use test equipment which has been calibrated within a period not exceeding the manufacturer's recommendation and which is traceable to the NIST.
- 1.6 Consider all reports to be the confidential property of the client, and distribute reports only to those persons designated by the client.

ARTICLE 2 - Client's Responsibilities, The Client will:

- 2.1 Provide all information necessary for proper performance of technical services.
- 2.2 Designate a person who is authorized to transmit instructions, receive information and test data reports, interpret and define Client's policies, and make decisions regarding technical services, as may be required at Clients expense.
- 2.3 Deliver without cost, representative samples of product for technical evaluation, together with any relevant data.
- 2.4 Furnish such labor and equipment necessary to handle sample product and to facilitate the technical evaluation.
- 2.5 The Client shall provide prior to the start of evaluation testing a signed Purchase Order for the amount agreed to by both parties.

ARTICLE 3 - General Requirements.

3.1 The only warranty made by Jabil Circuit, in connection with services performed thereunder is that it will use that degree of care and skill as stated in Article 1.1 and 1.3 above. No other warranty, expressed or implied, is made or intended for services provided thereunder.

Page: 36 of 36

- 3.2 Jabil Circuit shall supply technical services and prepare reports based solely on product samples submitted. The Client understands that application of the data to other devices is highly speculative and should be applied with extreme caution.
- 3.3 Jabil Circuit agrees to exercise ordinary care in receiving, preserving, and shipping any test sample to be tested, but assumes no responsibility for damages, either direct or consequential, which arise or are alleged to arise from loss, damage or destruction of the sample due to the act of examination, modification or testing, or technical analysis, or circumstances beyond our control.
- 3.4 The Client recognizes that generally accepted error variances apply and agrees to consider such error variances in its use of test data.
- 3.5 It is agreed between Jabil Circuit and Client that no distribution of any test reports, etc. shall be made to any third party without the prior written consent of both parties.
- 3.6 Test Reports may not be used by the Client to claim product endorsement by NVLAP or any agency of the U.S. Government.

ARTICLE 4 - Payment.

4.1 The Client agrees to pay for services and expenses as covered in the Purchase order or modified by Article 2.2. Jabil Circuit will present an invoice at the completion of work and will be paid within 30 days of receipt by Client unless the testing services are included with development services covered under a different agreement.
