To Whom It May Concern:

Chang Industry, Inc. hereby stipulates that the micro controller section of the video transmitter design (CE-T001) be regarded as a confidential design. The transmitter utilizes a phase locked oscillator that is inherently stable. The proprietary nature of this design poses the solution to the difficulty of providing a means of modulating the oscillator linearly, while continuing to maintain center frequency stability. We have developed a special loop filter/buffer amplifier circuit that allows for more accurate modulation of the transmitter's phase locked oscillator. It is imperative that this method for increasing transmitter performance be unrevealed.

Cordially,

Pablo De Los Rios
Senior RF Engineer
