Subject: RF MPE EXPOSURE
Re: FCC ID: PWO460009

To Whom It May Concern:

The MPE calculations for model 460009 signal booster were done for each frequency band, 800 MHz and 1900 MHz, for the highest gain less coax loss outside antennas. This is a directly connected signal booster and will not include inside antenna options. The order of the attached calculations is as follows:

1. 800 MHz band Outside Antenna: 311129-400100
2. 1900 MHz band Outside Antenna: 311101

A booster's uplink power must not exceed 1 watt equivalent isotropic radiated power (EIRP) for each band of operation. Composite downlink power must not exceed 0.05 watt EIRP for each band of operation (20.21(e)(8)(i)(D)). The following formula was used to calculate the equivalent isotropic radiated power:

EIRP= Power Out (Watts)*Duty Cycle Percent*Antenna Gain (non-log)*Coax loss (non-log)

The power density (mW/cm^2) is calculated using the following formula:

Calculated Power Density=1000*EIRP (Watts)/(4*π*(Distance from Antenna (cm)^2))
