

1. TEST METHODOLOGY

The RF output of EUT was connected to the power meter by RF cable and attenuator. The pathloss was compensated to the results for each measurement.

2. FCC RULES

According to 447498 D01 General RF Exposure Guidance v05r01

For minimum test separation distance $\leq 50\text{mm}$, Wifi standalone SAR test exclusion power threshold is determined by: $[(\text{max. power of channel, including tune-up tolerance, mW})/(\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] \leq 3.0$ for 1-g SAR and ≤ 7.5 for 10-g extremity SAR, where

- $f(\text{GHz})$ is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison

3. POWER Result

Worse case is 2412MHz : 9.64dBm (9.2mW)

Then $(9.2 \text{ mW}/5\text{mm}) \times \sqrt{2.412} = 2.86 < 3$

So SAR evaluation is not applicable
