

Test of: Radwin Ltd AP0158770 Wireless Module

To: FCC 47 CFR Part 90, Subpart Y; IC RSS-111

Test Report Serial No.: RDWN39-U10 Rev A

Test of Radwin Ltd AP0158770 Wireless Module

To FCC 47 CFR Part 90, Subpart Y; IC RSS-111

Test Report Serial No.: RDWN39-U10 Rev A

This report supersedes NONE

**Manufacturer:** RADWIN Ltd  
27 Habarzel Street  
Tel Aviv, 69710  
Israel

**Product Function:** 5 GHz Wireless Module

**Copy No:** pdf      **Issue Date:** 8th December 2015

**This Test Report is Issued Under the Authority of:**

## **ACCREDITATION, LISTINGS & RECOGNITION**

### **1.1. Testing Accreditation**

MiCOM Labs, Inc. is an accredited Electrical testing laboratory per the international standard ISO/IEC 17025:2005. The company is accredited by the American Association for Laboratory Accreditation (A2LA) [www.a2la.org](http://www.a2la.org) test laboratory number 2381.01. MiCOM Labs test schedule is available at the following URL; <http://www.a2la.org/scopepdf/2381-01.pdf>

---

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

| Singapore | Infocomm Development Authority (IDA)   | CAB    | APEC MRA 1 |   |
| Taiwan    | National Communications Commission (NCC)<br>Bureau of Standards, Metrology and Inspection (BSMI) | CAB    | APEC MRA 1 |   |
| Vietnam   | Ministry of Communication (MIC)  | CAB    | APEC MRA 1 |   |

EU MRA – European Union Mutual Recognition Agreement.

NB – Notified Body

APEC MRA – Asia Pacific Economic Community Mutual Recognition Agreement.

Recognition agreement under which test lab is accredited to regulatory standards of the APEC member countries.

Phase I - recognition for product testing

Phase II – recognition for both product testing and certification

MiCOM Labs, Inc. tested the equipment mentioned in accordance with the requirements set forth in the above standards. Test results indicate that the equipment tested is capable of demonstrating compliance with the requirements as documented within this report.

### Notes:

1. This document reports conditions under which testing was conducted and the results of testing performed.
2. Details of test methods used have been recorded and kept on file by the laboratory.
3. Test results apply only to the item(s) tested.

**Approved & Released for MiCOM Labs, Inc. by:**

  
\_\_\_\_\_  
Graeme Grieve  
Quality Manager MiCOM Labs,

  
  
\_\_\_\_\_  
Gordon Hurst  
President & CEO MiCOM Labs, Inc.

## **2.2. Test and Uncertainty Procedures**

Conducted and radiated emission measurements were conducted in accordance with American National Standards Institute ANSI C63.4, listed in the Normative References section of this report.

Measurement uncertainties stated are based on a standard uncertainty multiplied by a coverage factor  $k = 2$ , providing a level of confidence of approximately 95 % in accordance with UKAS document M 3003 listed in the Normative References section of this report.

### 3.2. Scope of Test Program

#### **AP0158770 RF Testing**

The scope of the test program was to test the AP0158770 5 GHz wireless module configurations in the frequency range 4,940 to 4,990 MHz for compliance against FCC 47 CFR Part 90 Subpart Y and Industry Canada RSS-111 specifications.

RADWIN Ltd  
AP0158770 Wireless Module

RADWIN Ltd  
AP0158770 Wireless Module (Rear)

**Title:** Radwin Ltd AP0158770 Wireless Module  
**To:** FCC 47 CFR Part 90, Subpart Y; IC RSS-111  
**Serial #:** RDWN39-U10 Rev A  
**Issue Date:** 8th December 2015  
**Page:** 15 of 118

### 3.3. Equipment Model(s) and Serial Number(s)

| Type (EUT/Support) | Equipment Description (Including Brand Name) | Manufacturer | Model No.    | Serial No. |
|--------------------|--|--------------|--------------|------------|
| EUT                | 5 GHz Wireless Module                        | RADWIN Ltd   | AP0158770    | Prototype  |
| Support            | POE 55 Vdc                                   | RADWIN Ltd   | CPU55A-270-1 | --         |
| Support            | Laptop PC                                    | IBM          | Thinkpad     | None       |

### 3.4. Antenna Details

Radiated emissions testing were performed in the mode with the highest spectral density to verify compliance. Radiated emissions were performed on the highest gain of each type of antenna as identified in the table below;-

| Antenna Type                        | Manufacturer | Model Number | Antenna Gain(dBi)<br>4.9-5.0 GHz |
|-------------------------------------|--------------|--------------|----------------------------------|

### 3.5. Cabling and I/O Ports

Number and type of I/O ports

1. 1 x 10/100/1000 Ethernet (includes POE +55 Vdc)

### 3.6. Test Configurations

Matrix of test configurations

| Parameter                   | Operational Mode | Test Conditions                               | Bandwidths (MHz) |
|-----------------------------|------------------|---|------------------|
| Occupied BW & Emission Mask | Modulated        | Ambient                                       | 5, 10, 20        |
| Peak Output power           | Modulated        | Ambient                                       | 5, 10, 20        |
| Peak Power Spectral Density | Modulated        | Ambient                                       | 5, 10, 20        |
| Frequency Stability         | Modulated        | Temperature Variations and Voltage Variations | 20               |
| Conducted Emissions         | Modulated        | Ambient                                       | 5, 10, 20        |
| Radiated Emissions          | Modulated        | Ambient                                       | 5, 10, 20        |

Only worst case plots are provided for each test parameter are identified within this report. Plots not included are held on file by the test laboratory and available upon request with client permission.

### **3.7. Equipment Modifications**

The following modifications were required to bring the equipment into compliance:

1. NONE

### **3.8. Deviations from the Test Standard**

The following deviations from the test standard were required in order to complete the test program:

1. NONE

### **3.9. Subcontracted Testing or Third Party Data**

1. NONE

| 2.1053;<br>90.210(m)<br>5.3 4.9    | Radiated Spurious Emissions                  | Spurious emissions<br>30 MHz – 40 GHz              | Radiated  | Complies | 6.1.7               |
| 4.10<br>6                          | Radiated Receiver Emissions                  |  |           | Complies | 6.1.8               |

**Note 1:** Test results reported in this document relate only to the items tested

**Note 2:** The required tests demonstrated compliance as per client declaration of test configuration, monitoring methodology and associated pass/fail criteria

**Note 3:** Section 3.7 Equipment Modifications highlights the equipment modifications that were required to bring the product into compliance with the above test matrix

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

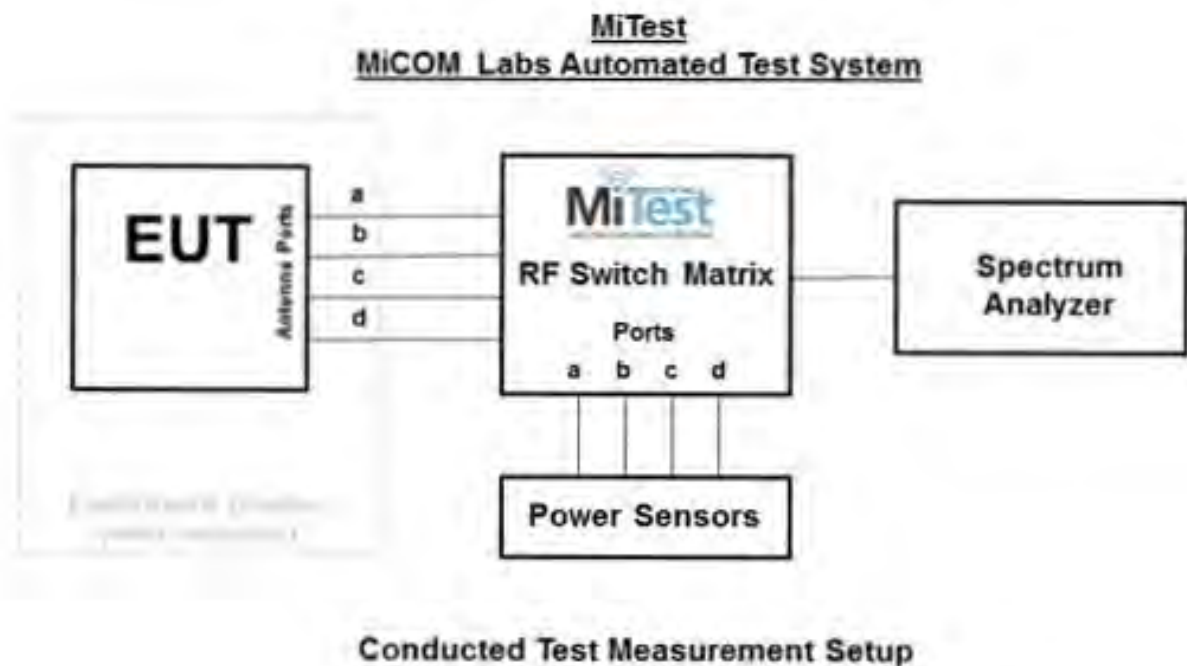

## **5. TEST EQUIPMENT CONFIGURATION(S)**

### **5.1. Conducted Test Set-Up**

Conducted RF Emission Test Set-up(s).

The following tests were performed using the conducted test set-up shown in the diagram below.

1. Occupied Bandwidth and Emission Mask
2. Peak Output Power
3. Peak Power Spectral Density
4. Frequency Stability
5. Spurious Emissions at Antenna Terminals - Transmitter

A full system calibration was performed on the test station and any resulting system losses (or gains) were taken into account in the production of all final measurement data.

## 5.2. Radiated Emission Test Set-Up

The following tests were performed using the conducted test set-up shown in the diagram below.

1. Radiated Spurious Emissions
2. Radiated Digital Emissions (0.03 – 1 GHz)
3. Receiver Spurious Emissions

A full system calibration was performed on the test station and any resulting system losses (or gains) were taken into account in the production of all final measurement data.

### 5.3. ac Wireline Emission Test Set-up

The following tests were performed using the conducted test set-up shown in the diagram below.

#### 1. ac Wireline Conducted Emissions

##### Test Measurement Set up

Measurement set up for AC Wireline Conducted Emissions Test

A full system calibration was performed on the test station and any resulting system losses (or gains) were taken into account in the production of all final measurement data.

##### Traceability of Test Equipment Utilized for ac Wireline Emission Testing

## **6. TEST RESULTS**

### **6.1. Device Characteristics**

#### **6.1.1. Occupied Bandwidth and Emission Mask**

##### **FCC 47 CFR Part 90, Subpart Y; 2.1049; §90.210(m)**

##### **Test Procedure**

The transmitter terminal of EUT was connected to the input of the spectrum analyzer set to measure the 26 dB occupied bandwidth and emission mask for the radio. The system highest power setting was selected with modulation ON and duty cycle set for 100% i.e. continuous operation at all times.

For emission masks the zero dB reference is measured relative to the highest average power of the fundamental emission measured across the designated channel bandwidth using a resolution bandwidth of at least one percent of the occupied bandwidth of the fundamental emission and a video bandwidth of 30 kHz.

Ambient conditions.

Temperature: 19 to 26 °C      Relative humidity: 31 to 57 %      Pressure: 999 to 1009 mbar

## Specification Limits

### FCC Part §90.210

#### Limits for Authorized Bandwidth

| Frequency Band (MHz) and Related Documents | Spectrum Masks with Audio Filter | Without Audio Filter |
|--|----------------------------------|----------------------|
| 4950 – 4990 MHz                            | L or M                           | L or M               |

Reference to the emission masks are provided below

#### Limits Emission Masks

##### 90.210(L)

*Emission Mask L.* For low power transmitters (20 dBm or less) operating in the 4940-4990 MHz frequency band, the power spectral density of the emissions must be attenuated below the output power of the transmitter as follows:

- (1) On any frequency removed from the assigned frequency between 0-45% of the authorized bandwidth (BW): 0 dB.
- (2) On any frequency removed from the assigned frequency between 45-50% of the authorized bandwidth:  $219 \log (\% \text{ of } (BW)/45)$  dB.
- (3) On any frequency removed from the assigned frequency between 50-55% of the authorized bandwidth:  $10 + 242 \log (\% \text{ of } (BW)/50)$  dB.
- (4) On any frequency removed from the assigned frequency between 55-100% of the authorized bandwidth:  $20 + 31 \log (\% \text{ of } (BW)/55)$  dB attenuation.
- (5) On any frequency removed from the assigned frequency between 100-150% of the authorized bandwidth:  $28 + 68 \log (\% \text{ of } (BW)/100)$  dB attenuation.
- (6) On any frequency removed from the assigned frequency above 150% of the authorized bandwidth: 40 dB.
- (7) The zero dB reference is measured relative to the highest average power of the fundamental emission measured across the designated channel bandwidth using a resolution bandwidth of at least one percent of the occupied bandwidth of the fundamental emission and a video bandwidth of 30 kHz. The power spectral density is the power measured within the resolution bandwidth of the measurement device divided by the resolution bandwidth of the measurement device. Emission levels are also based on the use of measurement instrumentation employing a resolution bandwidth of at least one percent of the occupied bandwidth.

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

## Limits Emission Masks (continued)

### 90.210(M),

(m) *Emission Mask M.* For high power transmitters (greater than 20 dBm) operating in the 4940-4990 MHz frequency band, the power spectral density of the emissions must be attenuated below the output power of the transmitter as follows:

(1) On any frequency removed from the assigned frequency between 0-45% of the authorized bandwidth (BW): 0 dB.

(2) On any frequency removed from the assigned frequency between 45-50% of the authorized bandwidth:  $56.8 \log (\% \text{ of } (BW)/45)$  dB.

(3) On any frequency removed from the assigned frequency between 50-55% of the authorized bandwidth:  $26 + 14.5 \log (\% \text{ of } (BW)/50)$  dB.

(4) On any frequency removed from the assigned frequency between 55-100% of the authorized bandwidth:  $32 + 3.1 \log (\% \text{ of } (BW)/55)$  dB.

(5) On any frequency removed from the assigned frequency between 100-150% of the authorized bandwidth:  $40 + 5.7 \log (\% \text{ of } (BW)/100)$  dB.

(6) On any frequency removed from the assigned frequency between above 150% of the authorized bandwidth: 50 dB or  $55 + 10 \log (P)$  dB, whichever is the lesser attenuation.

(7) The zero dB reference is measured relative to the highest average power of the fundamental emission measured across the designated channel bandwidth using a resolution bandwidth of at least one percent of the occupied bandwidth of the fundamental emission and a video bandwidth of 30 kHz. The power spectral density is the power measured within the resolution bandwidth of the measurement device divided by the resolution bandwidth of the measurement device. Emission levels are also based on the use of measurement instrumentation employing a resolution bandwidth of at least one percent of the occupied bandwidth.

NOTE TO PARAGRAPH ( m ): Low power devices may as an option, comply with paragraph (m).

## Laboratory Measurement Uncertainty for Power Measurements

|                         |               |
|-------------------------|---------------|
| Measurement uncertainty | $\pm 1.33$ dB |
|-------------------------|---------------|

## Traceability

| Method   |
|--|
| Measurements were made per work instruction WI-03<br>'Measurement of RF Spectrum Mask' |

---

### **6.1.2. Output Power**

#### **FCC 47 CFR Part 90, Subpart Y; §90.1215**

##### **Test Procedure**

Average power measurements were measured with the use of an average power head. Peak power measurements were recorded via the spectrum analyzer. The system highest power setting was selected with modulation ON. Should the device implement a duty cycle then this is added to the measured power as a Duty Cycle Correction Factor (DCCF).

## Specification Limits

### FCC Part §90.1215

Power limits.

The transmitting power of stations operating in the 4940-4990 MHz band must not exceed the maximum limits in this section.

(a)(1) The maximum conducted output power should not exceed:

| Channel Bandwidth<br>(MHz) | Low Transmitter Power<br>(dBm) | High Transmitter Power<br>(dBm) |
|----------------------------|--------------------------------|---------------------------------|
| 1                          | 7                              | 20                              |
| 5                          | 14                             | 27                              |
| 10                         | 17                             | 30                              |
| 15                         | 18.8                           | 31.8                            |
| 20                         | 20                             | 33                              |

(2) High power devices are also limited to a peak power spectral density of 21 dBm per one MHz. High power devices using channel bandwidths other than those listed above are permitted; however, they are limited to peak power spectral density of 21 dBm/MHz. If transmitting antennas of directional gain greater than 9 dBi are used, both the maximum conducted output power and the peak power spectral density should be reduced by the amount in decibels that the directional gain of the antenna exceeds 9 dBi. However, high power point-to-point and point-to-multipoint operations (both fixed and temporary-fixed rapid deployment) may employ transmitting antennas with directional gain up to 26 dBi without any corresponding reduction in the maximum conducted output power or spectral density. Corresponding reduction in the maximum conducted output power and peak power spectral density should be the amount in decibels that the directional gain of the antenna exceeds 26 dBi.

(b) Low power devices are also limited to a peak power spectral density of 8 dBm per one MHz. Low power devices using channel bandwidths other than those listed above are permitted; however, they are limited to a peak power spectral density of 8 dBm/MHz. If transmitting antennas of directional gain greater than 9 dBi are used, both the maximum conducted output power and the peak power spectral density should be reduced by the amount in decibels that the directional gain of the antenna exceeds 9 dBi.

(c) The maximum conducted output power is measured as a conducted emission over any interval of continuous transmission using instrumentation calibrated in terms of an RMS-equivalent voltage. If the device cannot be connected directly, alternative techniques acceptable to the Commission may be used. The measurement results shall be properly adjusted for any instrument limitations, such as detector response times, limited resolution bandwidth capability when compared to the emission bandwidth, sensitivity, etc., so as to obtain a true maximum conducted output power measurement conforming to the definitions in this paragraph for the emission in question.

**Page:** 48 of 118

---

(d) The peak power spectral density is measured as conducted emission by direct connection of a calibrated test instrument to the equipment under test. If the device cannot be connected directly, alternative techniques acceptable to the Commission may be used. Measurements are made over a bandwidth of one MHz or the 26 dB emission bandwidth of the device, whichever is less. A resolution bandwidth less than the measurement bandwidth can be used, provided that the measured power is integrated to show total power over the measurement bandwidth. If the resolution bandwidth is approximately equal to the measurement bandwidth, and much less than the emission bandwidth of the equipment under test, the measured results shall be corrected to account for any difference between the resolution bandwidth of the test instrument and its actual noise bandwidth.

(e) The ratio of the peak excursion of the modulation envelope (measured using a peak hold function) to the maximum conducted output power shall not exceed 13 dB across any 1 MHz bandwidth or the emission bandwidth whichever is less.

### **6.1.3. Peak Power Spectral Density (PPSD)**

#### **FCC 47 CFR Part 90, Subpart Y; §90.1215**

##### **Test Procedure**

The test methodology used for this measurement was determined to provide the highest possible PPSD readings.

Peak power spectral density measurements were performed via the spectrum analyzer and plots were recorded. Modulation was ON and the system duty cycle was set for 100% i.e. continuous operation at all times. The system highest power setting was selected with modulation ON and duty cycle set for 100% i.e. continuous operation at all times.

**6.1.4. Maximum Permissible Exposure**  
**FCC, Part 90 Subpart C §90.1217**  
**Industry Canada RSS-Gen §5.6**

**Calculations for Maximum Permissible Exposure Levels**

Power Density = Pd (mW/cm<sup>2</sup>) = EIRP/(4πd<sup>2</sup>)

EIRP = P \* G

P = Peak output power (mW)

G = Antenna numeric gain (numeric)

d = Separation distance (cm)

Numeric Gain = 10 ^ (G (dBi)/10)

Because the EUT belongs to the General Population/Uncontrolled Exposure the limit of power density is 1.0 mW/cm<sup>2</sup>

**Note:** for mobile or fixed location transmitters the minimum separation distance is 20cm, even if calculations indicate the MPE distance to be less.

**Specification**

**Maximum Permissible Exposure Limits**

**§90.1217**

Licensees and manufacturers are subject to the radiofrequency radiation exposure requirements specified in §§ 1.1307(b), 2.1091 and 2.1093 of this chapter, as appropriate. Applications for equipment authorization of mobile or portable devices operating under this section must contain a statement confirming compliance with these requirements for both fundamental emissions and unwanted emissions. Technical information showing the basis for this statement must be submitted to the Commission upon request.

**FCC §1.1310** Limit = 1mW / cm<sup>2</sup> from 1.310 Table 1

**RSS-Gen §5.6** Category I and Category II equipment shall comply with the applicable requirements of RSS-102.

**Laboratory Measurement Uncertainty for Power Measurements**

Measurement uncertainty

±1.33dB

#### **6.1.5. Frequency Stability; Temperature Variations, and Voltage Variations**

##### **FCC 47 CFR Part 90, Subpart Y; §90.213**

##### **Test Procedure**

The transmitter output was connected to a spectrum analyzer and the frequency stability was measured in either modulated or unmodulated state. Frequency stability was measured through the extremes of temperature on the selected channel only. Prior to a taking a frequency / temperature measurement the device is powered off and the temperature changed. The device is left to stabilize at the new temperature for 15 mins then switched on before any measurement is taken.

Date: 30.JUL.2015 11:28:28

The figure is a spectrum plot from a VectorStar instrument. It shows a noisy signal centered at 4.965005012 GHz. The y-axis represents power in dBm, ranging from -79.8 to 20.2. The x-axis represents frequency, with a center frequency of 4.965005012 GHz and a span of 1 kHz. A blue trace shows the signal, with a peak at 4.96500508 GHz marked by a blue arrow and labeled '1'. The plot includes a grid and various measurement parameters such as RBW (20 Hz), VBW (20 Hz), and RF Att (20 dB). The signal level is -15.81 dBm. The plot also shows a 20.2 dB offset and a 100 Hz resolution bandwidth. The date and time are 30.JUL.2015 11:28:28.

#### **6.1.6. Spurious Emissions at Antenna Terminals - Transmitter**

##### **FCC 47 CFR Part 90, Subpart Y; §90.210(m)**

##### **Test Procedure**

Transmitter conducted spurious emissions were measured for each bandwidth. Measurement were made while EUT was operating in a modulated transmit mode of operation, at the appropriate center frequency, 100% duty cycle and maximum power at all times. Conducted spurious emissions were measured to 40 GHz.

Conducted spurious emissions' testing was performed only in the configuration with the highest spectral density.

From FCC Part 90.210 (m)

On any frequency removed from the assigned frequency between above 150 % of the authorized bandwidth: 50 dB or  $55 + 10 \log (P)$  dB, (P in Watts) whichever is the lesser attenuation.

## TABLE OF RESULTS – 5 MHz Bandwidth

**PORT A Limit: -25 dBm**

|               | Frequency (MHz) |            |                                |                          |             |

#### **6.1.7. Radiated Spurious Emissions**

##### **FCC 47 CFR Part 90, §90.210(m)**

##### **Test Procedure**

Measurements were made while EUT was operating in a modulated transmit mode of operation, at the appropriate center frequency, 100% duty cycle and maximum power at all times. Radiated spurious emissions were measured to 40 GHz. Substitution was performed on any emissions observed. The antenna port was attenuated with 50 dB attenuation plus a 50  $\Omega$  terminator.

The measurement equipment was set to measure in peak hold mode. The emissions were measured in the anechoic chamber at a 3-meter distance on every azimuth in both horizontal and vertical polarities. The emissions are recorded and maximized as a function of azimuth by rotation through 360° with a spectrum analyzer in peak hold mode.

The highest emissions relative to the limit are listed for each frequency spanned.

Measurements below 1 GHz utilized 100 KHz RBW, measurements above 1 GHz were performed using a minimum RBW of 1 MHz.

From FCC Part 90.210 (m)

On any frequency removed from the assigned frequency between above 150 % of the authorized bandwidth: 50 dB or  $55 + 10 \log (P)$  dB, whichever is the lesser attenuation.

Radiated emissions' testing was performed only in the configuration with the highest spectral density.

Attenuation

$55 + 10 \log (P)$  dB for 5 MHz bandwidth = 49.1 dB attenuation (P is in Watts)

Therefore maximum attenuation for any channel spacing is = 49.1 dB

5 MHz bandwidth limit:  $+24.1 - 49.1 = -25$  dBm (82 dBuV)

Emission measurements were performed to the 10<sup>th</sup> harmonic of the transmitter. No emissions were found.

#### **6.1.8. Digital Emissions (0.03 – 1 GHz)**

##### **FCC, Part 15 Subpart C §15.205/ §15.209**

##### **Test Procedure**

Testing 30M-1 GHz was performed in a 3-meter anechoic chamber using a CISPR compliant receiver. Preliminary radiated emissions were measured on every azimuth and with the receiving antenna in both horizontal and vertical polarizations. To further maximize emissions the receive antenna was varied between 1 and 4 meters. The emissions are recorded with receiver in peak hold mode. Emissions closest to the limits are measured in the quasi-peak mode with the tuned receiver using a bandwidth of 120 kHz. Only the highest emissions relative to the limit are listed. The anechoic chamber test set-up is identified in Section 6 Test Set-Up Photographs.

##### **Field Strength Calculation**

The field strength is calculated by adding the Antenna Factor and Cable Loss, and subtracting Amplifier Gain from the measured reading. In this test facility, the Antenna Factor, Cable Loss, and Amplifier Gains are loaded into the Rohde & Schwarz Receiver and the corrected field strength can be read directly on the receiver.

$$FS = R + AF + CORR$$

where:

FS = Field Strength

R = Measured Receiver Input Amplitude

AF = Antenna Factor

CORR = Correction Factor = CL – AG + NFL

CL = Cable Loss

AG = Amplifier Gain

For example:

Given a Receiver input reading of 51.5dB $\mu$ V; Antenna Factor of 8.5dB; Cable Loss of 1.3dB; Falloff Factor of 0dB, an Amplifier Gain of 26dB and Notch Filter Loss of 1dB. The Field Strength of the measured emission is:

$$FS = 51.5 + 8.5 + 1.3 - 26.0 + 1 = 36.3\text{dB}\mu\text{V/m}$$

Conversion between dB $\mu$ V/m (or dB $\mu$ V) and  $\mu$ V/m (or  $\mu$ V) are done as:

$$\text{Level (dB}\mu\text{V/m)} = 20 * \text{Log (level (}\mu\text{V/m))}$$

$$40 \text{ dB}\mu\text{V/m} = 100 \mu\text{V/m}$$

#### 6.1.9. Receiver Radiated Spurious Emissions (above 1 GHz)

##### Industry Canada RSS-Gen §4.10, §6

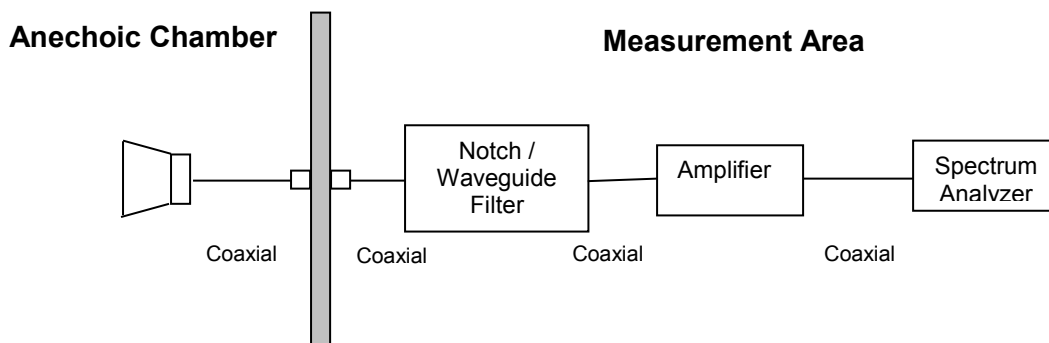

#### Test Procedure

Radiated emissions above 1 GHz are measured in the anechoic chamber at a 3-meter distance on every azimuth in both horizontal and vertical polarities. The emissions are recorded and maximized as a function of azimuth by rotation through 360° with a spectrum analyzer in peak hold mode. Depending on the frequency band spanned a notch filter and waveguide filter was used to remove the fundamental frequency. The highest emissions relative to the limit are listed for each frequency spanned.

All measurements on any frequency or frequencies over 1 MHz are based on the use of measurement instrumentation employing an average detector function. All measurements above 1 GHz were performed using a minimum resolution bandwidth of 1 MHz.

All Sectors of the EUT were tested simultaneously

#### Test Measurement Set up

Measurement set up for Radiated Emission Test

#### Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Loss, and subtracting Amplifier Gain from the measured reading. All factors are included in the reported data.

$$FS = R + AF + CORR - FO$$

where: FS = Field Strength  
R = Measured Spectrum analyzer Input Amplitude  
AF = Antenna Factor  
CORR = Correction Factor = CL – AG + NFL  
CL = Cable Loss  
AG = Amplifier Gain  
FO = Distance Falloff Factor  
NFL = Notch Filter Loss or Waveguide Loss

**Title:** Radwin Ltd AP0158770 Wireless Module  
**To:** FCC 47 CFR Part 90, Subpart Y; IC RSS-111  
**Serial #:** RDWN39-U10 Rev A  
**Issue Date:** 8th December 2015  
**Page:** 107 of 118

---

For example:

Given receiver input reading of 51.5 dB $\mu$ V; Antenna Factor of 8.5 dB; Cable Loss of 1.3 dB; Falloff Factor of 0 dB, an Amplifier Gain of 26 dB and Notch Filter Loss of 1 dB. The Field Strength of the measured emission is:

$$FS = 51.5 + 8.5 + 1.3 - 26.0 + 1 = 36.3 \text{ dB}\mu\text{V/m}$$

Conversion between dB $\mu$ V/m (or dB $\mu$ V) and  $\mu$ V/m (or  $\mu$ V) are done as:

$$\text{Level (dB}\mu\text{V/m)} = 20 * \text{Log (level (}\mu\text{V/m))}$$

$$40 \text{ dB}\mu\text{V/m} = 100 \mu\text{V/m}$$

$$48 \text{ dB}\mu\text{V/m} = 250 \mu\text{V/m}$$

## Specification

### Radiated Receiver Spurious Emissions

**RSS-Gen §4.10** the search for spurious emissions shall be from the lowest frequency internally generated or used in the receiver (e.g.. local oscillator, intermediate or carrier frequency), or 30 MHz, whichever is higher, to at least 3 times the highest tunable or local oscillator frequency, whichever is higher, without exceeding 40 GHz.

For emissions below 1000 MHz, measurements shall be performed using a CISPR quasi-peak detector and the related measurement bandwidth. As an alternative to CISPR quasi-peak measurement, compliance with the emission limit can be demonstrated using measuring equipment employing a peak detector function properly adjusted for factors such as pulse desensitization as required, with an equal or greater measurement bandwidth relative to the applicable CISPR quasi-peak bandwidth.

Above 1000 MHz, measurements shall be performed using an average detector with a minimum resolution bandwidth of 1 MHz.

#### **RSS-Gen §6** Receiver Spurious Radiated Limits

Spurious emissions from receivers shall not exceed the radiated limits shown in the table below:

### RSS-Gen Spurious Emissions Limits

| Frequency (MHz) | Field Strength (µV/m) | Field Strength (dBµV/m) | Measurement Distance (meters) |
|-----------------|-----------------------|-------------------------|-------------------------------|
| 30-88           | 100                   | 40.0                    | 3                             |
| 88-216          | 150                   | 43.5                    | 3                             |
| 216-960         | 200                   | 46.0                    | 3                             |
| Above 960       | 500                   | 54.0                    | 3                             |

#### **6.1.10. ac Wireline Emissions**

##### **FCC, Part 15 Subpart C §15.207**

##### **Test Procedure**

The EUT is configured in accordance with ANSI C63.4. The conducted emissions are measured in a shielded room with a spectrum analyzer in peak hold in the first instance. Emissions closest to the limit are measured in the quasi-peak mode (QP) with the tuned receiver using a bandwidth of 9 kHz. The emissions are maximized further by cable manipulation. The highest emissions relative to the limit are listed.

## Specification

### Limits

**§15.207 (a)** Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits in the following table, as measured using a 50  $\mu\Omega$  line impedance stabilization network (LISN), see §15.207 (a) matrix below. Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal.

### §15.207 (a) Limit Matrix

The lower limit applies at the boundary between frequency ranges

| Frequency of Emission (MHz) | Conducted Limit (dB $\mu$ V) |           |
|-----------------------------|------------------------------|-----------|
|                             | Quasi-peak                   | Average   |
| 0.15-0.5                    | 66 to 56*                    | 56 to 46* |
| 0.5-5                       | 56                           | 46        |
| 5-30                        | 60                           | 50        |

\* Decreases with the logarithm of the frequency

### Laboratory Measurement Uncertainty for Conducted Emissions

|                         |               |
|-------------------------|---------------|
| Measurement uncertainty | $\pm 2.64$ dB |
|-------------------------|---------------|
