To Whom It May Concern

Subject: QT-300 Form Factor Configuration Control

This letter is to outline the QT-300 form factor control setting and the procedure to finalize the QT-300 form factor configuration.

Every QT-300 Module is calibrated, tested and configured in an computer automated procedure. All parameters are calibrated and set to confirm with the QT-300 Module specifications.

Once the Module has passed QC inspection the QT-300 modules are then integrated into the final form factor. The feature settings for each form factor (Frequency Range, Output Power) are set by production technicians at this point and the device firmware will then restrict these setting appropriately for the end user.
