4. RF Exposure Limit Introduction

According to ANSI/IEEE C95.1-1992, the criteria listed in Table 1 shall be used to evaluate the environmental impact of human exposure to radio frequency (RF) radiation as specified in §1.1310.

Frequency range (MHz)	Electric field strength (V/m)	Magnetic field strength (A/m)	Power density (mW/cm ²)	Averaging time (minutes)
(A) Limits for Occupational/Controlled Exposures				
0.3-3.0	614	1.63	*(100)	6
3.0-30	1842/f	4.89/f	*(900/f ²)	6
30-300	61.4	0.163	1.0	6
300-1500			f/300	6
1500-100,000			5	6
(B) Limits for General Population/Uncontrolled Exposure				
0.3-1.34	614	1.63	*(100)	30
1.34-30	824/f	2.19/f	*(180/f ²)	30
30-300	27.5	0.073	0.2	30
300-1500			f/1500	30
1500-100,000			1.0	30

The MPE was calculated at 20 cm to show compliance with the power density limit.

The following formula was used to calculate the Power Density:

$$S = \frac{PG}{4\pi R^2}$$

Where:

S = Power Density

P = Output Power at Antenna Terminals

G = Gain of Transmit Antenna (linear gain)

R = Distance from Transmitting Antenna

Note:

1. For conservativeness, the lowest uplink frequency of each band is used to determine the MPE limit of that band.
2. In the above table have assessed WLAN 2.4GHz, WLAN 5GHz and Bluetooth by referring to their maximum antenna gain and maximum output power.

Note:

1. For conservativeness, the lowest uplink frequency of each band is used to determine the MPE limit of that band.
2. This device support beamforming for WLAN 2.4GHz 802.11n HT20/HT40 and WLAN 5GHz 802.11n/ac HT20/HT40/VHT20/VHT40/VHT80.
3. In the above table have assessed WLAN 2.4GHz and WLAN 5GHz by referring to their maximum direction gain and maximum output power.
4. For model APIN0304 with WLAN 2.4GHz, the dual-polarized sector antenna with maximum antenna gain 7.5dBi which we choosed without beamforming antenna gain because of irrelevant of polarization. So for beamforming mode, we also use 7.5dBi to evaluate MPE test. For model APIN0304 with WLAN 5GHz on the maximum antenna gain 7.5dBi, the beamforming antenna gain is not equal to add $10\log(3)=4.77$ dBi but 3.01 dBi because of the dual-polarization. So we choose the secondary antenna with antenna gain 6dBi to evaluate MPE test.
5. For model APIN0305, composited gain for each antenna is 2.4dBi in 2.4GHz and 2.8dBi in 5GHz. And the beamforming gain is equal to each antenna add $10\log(N)$ dB, where N is the number of outputs.

**5.2. Collocated Power Density Calculation**

Model Name	Band	Maximum WLAN Power Density / Limit	Maximum Bluetooth Power Density / Limit	Σ (Power Density / Limit) of WLAN 2.4GHz + WLAN 5GHz + Bluetooth
APIN0304	WLAN2.4GHz Band	0.1581	0.0006	0.6907
	WLAN5GHz Band	0.5320		
APIN0305	WLAN2.4GHz Band	0.0692	0.0005	0.3244
	WLAN5GHz Band	0.2547		

Note:

1. Σ (Power Density / Limit): This is a summation of [(power density for each transmitter/antenna included in the simultaneous transmission)/ (corresponding MPE limit)], for WLAN 2.4GHz+WLAN 5GHz + Bluetooth.
2. Considering the all antennas collocation of the EIRP performance listed in the table above, the aggregated (power density /limit) is smaller than 1, and MPE of 3 collocated transmitters is compliant.

Conclusion:

According to 47 CFR §2.1091, the RF exposure analysis concludes that the RF Exposure is FCC compliant.
