

### **Prediction of MPE limit at a given distance**

Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = \frac{PG}{4\pi R^2}$$

where: S = power density

P = power input to the antenna

G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna

Maximum peak output power at the antenna terminal: 16.47 (dBm)

Maximum peak output power at the antenna terminal: 44.36086439 (mW)

Antenna gain(typical): 4 (dBi)

Maximum antenna gain: 2.511886432 (numeric)

Prediction distance: 20 (cm)

Prediction frequency: 1960 (MHz)

MPE limit for uncontrolled exposure at prediction frequency: 1 (mW/cm<sup>2</sup>)

**Power density** at prediction frequency: **0.022168** (mW/cm<sup>2</sup>)

**Device complies with FCC RF radiation exposure limits for general population as a mobile device (d>20cm).**
