

board assembly. The Model MB operates from the 115 vac power line. The power supply (schematic 3101232) contains a voltage regulator that maintains an output of approximately 13.8 v. within 0.1 volt for 105-125 volt ac line variation. Thus the actual supply voltage stability for this model will be considerably better than shown on the graph for the voltage range 10-16 v.
