

Correspondence summary for FCC correspondence number 7340.

3/24/03 reply from test lab:

The device was tested per Part 15.231(b) and the transmitter is activated when the transmitter of the main controls the remote siren(optional accessory not included in this category).

The above is stated in the test report of main.

3/27/03 TCB question and answer from test lab:

Please, kindly, answer the following question from the FCC:

1. The plot, also, does not indicate how the power line conducted measurements were made. Was the plot made while the EUT was transmitting, receiving, during audio communications, etc..??

Response : Yes, the plot was made while the EUT was transmitting and receiving so that power line has maximum load.
But this device has no function of audio communications.
