4. Subject of Investigation

The objective of the evaluation done by CETECOM Inc. was to assess the applicability of SAR evaluation exclusion according to methods described in applicable standards.

4.1. The FCC Exposure Criteria

The FCC SAR test exclusions are set by FCC KDB 447498 section 4.3.

5. Standalone SAR Evaluation Exclusion

According to KDB 447498, SAR evaluation can be excluded if the following equation is satisfied:

$$[(\text{max. power of channel, including tune-up tolerance, mW})/(\text{min. test separation distance, mm})] \cdot [\sqrt{f_{\text{(GHz)}}}] \leq 3.0$$

The maximum power of is 1 mW (0 dBm). A minimum test separation distance of 5 mm is used for this calculation because the minimum test separation distance is less than 5 mm.

Applying the above equation a value of $[(1 \text{ mW})/(5 \text{ mm})] \cdot [\sqrt{2.480}] = 0.3$

is resulting which is below the threshold of 3.0 so that **SAR testing can be excluded**.

6. Simultaneous Transmission SAR Evaluation Exclusion

The EUT is limited for use with the iPhone 6 and iPhone 6s because the sleeve has a lightning connector that is always inserted in the phone when the sleeve is attached and the sleeve is made specifically for the shape and dimensions of the iPhone 6 and iPhone 6s. Simultaneous transmission is evaluated when the Bluetooth LE radio of the EUT simultaneously transmits with the radios of the iPhone 6 and iPhone 6s. Reported SAR values listed in the SAR test reports published under the respective FCC IDs of the iPhones are used for the evaluation.

	iPhone 6	iPhone 6S
FCC ID	BCG-E2816A	BCG-E2946A
Test Lab	UL Verification Services Inc.	UL Verification Services Inc.
Test Report Number	14U17673-S1C	15U20164-S1V5

The Bluetooth LE radio of the EUT is only used to wake up the iPhone from sleep/standby mode. The radio will transmit only after user interaction with the EUT.

6.1. Standalone SAR Estimation

The standalone estimated SAR value is calculated according to KDB 447498, section 4.3.2:

$$[(\text{max. power of channel, including tune-up tolerance, mW})/(\text{min. test separation distance, mm})] \cdot [\sqrt{f_{\text{(GHz)}}/x}].$$

Where $x = 7.5$ when estimating 1-g SAR.

The standalone SAR value for the Bluetooth radio of the EUT is

$$[(1 \text{ mW})/(5 \text{ mm})] \cdot [\sqrt{2.48/7.5}] = \mathbf{0.04 \text{ W/kg}}$$

The output power used to calculate the SAR value is the burst average power. The time average power would be less than 1 mW. **The estimated 1g SAR value of 0.04 W/kg is a conservative worst case.**

6.2. Simultaneous Transmission with the iPhone 6

According to the iPhone's SAR test reports, under simultaneous transmission conditions the Bluetooth radio of the phone is active for body-worn accessory RF exposure conditions. The following simultaneous conditions are possible

iPhone Radio(s)		EUT Radio
Cellular		Bluetooth LE
Wi-Fi UNII Band		Bluetooth LE
Cellular	Wi-Fi UNII Band	Bluetooth LE

The following SAR values for the iPhone 6 are taken from section 13 of the iPhone's SAR test report.
