

# Test report

**237220-2R2TRFWL**

Date of issue: October 24, 2013

Applicant:

**Ericsson WiFi Inc.**

Product:

**Wi-Fi Access Point**

Model:

**AP 5115**

Model variants:

**AP 5116, AP 5117, AP 5118, AP 5119**

FCC ID:

**RAR40085008**

IC Registration number:

**4674A-40085008**

Specifications:

◆ **FCC 47 CFR Part 15 Subpart C, §15.247**

Operation in the 902–928 MHz, 2400–2483.5 MHz, 5725–5850 MHz

◆ **RSS-210, Issue 8, December 2010, Annex 8**

Frequency Hopping and Digital Modulation Systems Operating in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz Bands

## Section 1. Report summary

### 1.1 Applicant and manufacturer

|                  |                    |
|------------------|--------------------|
| Company name:    | Ericsson WiFi Inc. |
| Address:         | 6300 Legacy Drive  |
| City:            | Plano              |
| Province/State:  | TX                 |
| Postal/Zip code: | 75024              |
| Country:         | USA                |

### 1.2 Test specifications

|  |   |
|--|---|
| FCC 47 CFR Part 15, Subpart C, Clause 15.247 | Operation in the 902–928 MHz, 2400–2483.5 MHz, 5725–5850 MHz  |
| RSS-210, Issue 8, December 2010, Annex 8     | Frequency Hopping and Digital Modulation Systems Operating in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz Bands |

### 1.3 Test methods

|   |  |
|---|--|
| 558074 D01 Meas Guidance v03r01 (April 9, 2013)           | Guidance for compliance measurements on DTS operating under 15.247   |
| 662911 D01 Multiple Transmitter Output v02 (May 28, 2013) | Emissions testing of transmitters with multiple outputs in the same band (MIMO)  |
| ANSI C64.3 v 2003   | American National Standard for Methods of Measurement of Radio- Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz |

### 1.4 Statement of compliance

In the configuration tested, the EUT was found compliant.

Testing was completed against all relevant requirements of the test standard. Results obtained indicate that the product under test complies in full with the requirements tested. The test results relate only to the items tested.

See “Summary of test results” for full details.

### 1.5 Exclusions

None

### 1.6 Test report revision history

| Revision # | Details of changes made to test report      |
|------------|---|
| TRF        | Original report issued                      |
| R1TRF      | Model numbers update                        |
| R2TRF      | Model numbers update to remove BelAir brand |

## Section 2. Summary of test results

### 2.1 FCC Part 15 Subpart C, general requirements test results

| Part        | Test description          | Verdict           |
|-------------|---------------------------|-------------------|
| \$15.207(a) | Conducted limits          | Pass              |
| \$15.31(e)  | Variation of power source | Pass <sup>1</sup> |
| \$15.203    | Antenna requirement       | Pass <sup>2</sup> |

Notes: <sup>1</sup> Measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, was performed with the supply voltage varied between 85 % and 115 % of the nominal rated supply voltage. No noticeable output power variation was observed

<sup>2</sup> The Antennas are located within the enclosure of EUT and not user accessible.

### 2.2 FCC Part 15 Subpart C, intentional radiators test results

| Part                | Test description   | Verdict        |
|---------------------|--|----------------|
| \$15.247(a)(1)(i)   | Frequency hopping systems operating in the 902–928 MHz band  | Not applicable |
| \$15.247(a)(1)(ii)  | Frequency hopping systems operating in the 5725–5850 MHz band  | Not applicable |
| \$15.247(a)(1)(iii) | Frequency hopping systems operating in the 2400–2483.5 MHz band  | Not applicable |
| \$15.247(a)(2)      | Minimum 6 dB bandwidth for systems using digital modulation techniques   | Pass           |
| \$15.247(b)(1)&(4)  | Maximum peak output power of frequency hopping systems operating in the 2400–2483.5 MHz band and 5725–5850 MHz band        | Not applicable |
| \$15.247(b)(2)&(4)  | Maximum peak output power of Frequency hopping systems operating in the 902–928 MHz band                                   | Not applicable |
| \$15.247(b)(3)&(4)  | Maximum peak output power of systems using digital modulation in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz bands | Pass           |
| \$15.247(c)(1)      | Fixed point-to-point operation with directional antenna gains greater than 6 dBi   | Not applicable |
| \$15.247(c)(2)      | Transmitters operating in the 2400–2483.5 MHz band that emit multiple directional beams                                    | Not applicable |
| \$15.247(d)         | Spurious emissions   | Pass           |
| \$15.247(e)         | Power spectral density for digitally modulated devices   | Pass           |
| \$15.247(f)         | Time of occupancy for hybrid systems   | Not applicable |

### 2.3 IC RSS-GEN, Issue 3, test results

| Part  | Test description                                       | Verdict        |
|-------|--|----------------|
| 4.6.1 | Occupied bandwidth                                     | Pass           |
| 4.7   | Transmitter frequency stability                        | Not applicable |
| 6.1   | Receiver spurious emissions limits (radiated)          | Not applicable |
| 6.2   | Receiver spurious emissions limits (antenna conducted) | Not applicable |
| 7.2.4 | AC power lines conducted emission limits               | Pass           |

Notes: <sup>1</sup> According to Notice 2012-DRS0126 (from January 2012) section 2.2 of RSS-Gen, Issue 3 has been revised. The EUT does not have a stand-alone receiver neither scanner receiver, therefore exempt from receiver requirements.

## 2.4 IC RSS-210, Issue 8, test results

| Part     | Test description   | Verdict        |
|----------|--|----------------|
| A8.1     | Frequency hopping systems  |                |
| A8.1 (a) | Bandwidth of a frequency hopping channel   | Not applicable |
| A8.1 (b) | Minimum channel spacing for frequency hopping systems                                  | Not applicable |
| A8.1 (c) | Frequency hopping systems operating in the 902–928 MHz band                            | Not applicable |
| A8.1 (d) | Frequency hopping systems operating in the 2400–2483.5 MHz band                        | Not applicable |
| A8.1 (e) | Frequency hopping systems operating in the 5725–5850 MHz band                          | Not applicable |
| A8.2     | Digital modulation systems   |                |
| A8.2 (a) | Minimum 6 dB bandwidth   | Pass           |
| A8.2 (b) | Maximum power spectral density   | Pass           |
| A8.3     | Hybrid systems   |                |
| A8.3 (1) | Digital modulation turned off  | Not applicable |
| A8.3 (2) | Frequency hopping turned off   | Not applicable |
| A8.4     | Transmitter output power and e.i.r.p. requirements                                     |                |
| A8.4 (1) | Frequency hopping systems operating in the 902–928 MHz band                            | Not applicable |
| A8.4 (2) | Frequency hopping systems operating in the 2400–2483.5 MHz band                        | Not applicable |
| A8.4 (3) | Frequency hopping systems operating in the 5725–5850 MHz                               | Not applicable |
| A8.4 (4) | Systems employing digital modulation techniques  | Pass           |
| A8.4 (5) | Point-to-point systems in 2400–2483.5 MHz and 5725–5850 MHz band                       | Not applicable |
| A8.4 (6) | Transmitters which operate in the 2400–2483.5 MHz band with multiple directional beams | Not applicable |
| A8.5     | Out-of-band emissions  | Pass           |

Notes: None

## Section 3. Equipment under test (EUT) details

### 3.1 Sample information

|                        |               |
|------------------------|---------------|
| Receipt date           | June 18, 2013 |
| Nemko sample ID number | 1             |

### 3.2 EUT information

|                |   |
|----------------|---|
| Product name   | Wi-Fi Access Point  |
| Model          | AP 5115   |
| Model variants | Please refer to the table 3.3–1 and 3.3–2 below for complete list of model variants |
| Serial number  | 201352811810  |

### 3.3 Technical information

|                           |   |
|---------------------------|---|
| Operating band            | 5725–5850 MHz   |
| Operating frequency       | 5745–5825 MHz (20 MHz channel) and 5755–5815 MHz (40 MHz channel)   |
| Modulation type           | 802.11a/n   |
| Occupied bandwidth (99 %) | 16.66 MHz (802.11a); 17.18 MHz (802.11n HT20); 37.00 MHz (802.11n HT40)   |
| Emission designator       | W7D   |
| Power requirements        | 48 V <sub>DC</sub> via PoE at 120 V <sub>AC</sub> , 60 Hz or direct AC mains connection to 120 V <sub>AC</sub> , 60 Hz  |
| Antenna information       | The EUT uses a unique antenna coupling/ non-detachable antenna to the intentional radiator. For the antenna configurations please refer to Table 3.3–1 and 3.3–2 below. |

**Table 3.3-1: Product model variants**

| Product | Powering | Antenna type                               | Antenna gain, dBi |
|---------|----------|--|-------------------|
| AP 5115 | AC       | Two internal, omnidirectional              | 6.7               |
| AP 5116 | AC       | Two internal, directional, cross polarized | 11.5              |
| AP 5117 | AC       | Two external, directional, cross polarized | 11.5              |
| AP 5118 | AC       | Two internal, directional, cross polarized | 11.5              |
| AP 5119 | AC       | Two internal, directional, cross polarized | 12                |

Note: cross polarized antennas are such as one of the transmitter's outputs is a 90-degree phase-shifted replica of the other and the phase centers of the two antennas are co-located.

### 3.4 Product description and theory of operation

The EUT is device designed to operate in the 2.4 GHz band, and 5 GHz 2x2 MIMO ISM and UNII bands. There are two independent radio units. This report covers only the 5 GHz DTS radio.

### 3.5 EUT exercise details

The EUT was controlled to transmit at desired frequency and modulation from laptop using Art GUI software and telnet session.

3.6 EUT setup diagram

Figure 3.6-1: Setup diagram

3.7 EUT sub assemblies

Table 3.7-1: EUT sub assemblies

| Description | Brand name                   | Model/Part number | Serial number     |
|-------------|------------------------------|-------------------|-------------------|
| Laptop      | Toshiba                      | Satellite         | Asset number: 441 |
| PoE adapter | Cincon Electronics Co., Ltd. | TRG60A-POE-L      | RD Sample 4 1127  |

## Section 4. Engineering considerations

---

### 4.1 Modifications incorporated in the EUT

---

There were no modifications performed to the EUT during this assessment.

### 4.2 Technical judgment

---

None.

### 4.3 Deviations from laboratory tests procedures

---

No deviations were made from laboratory procedures.

# Section 5. Test conditions

---

## 5.1 Atmospheric conditions

---

|                   |               |
|-------------------|---------------|
| Temperature       | 15–30 °C      |
| Relative humidity | 20–75 %       |
| Air pressure      | 860–1060 mbar |

When it is impracticable to carry out tests under these conditions, a note to this effect stating the ambient temperature and relative humidity during the tests shall be recorded and stated.

## 5.2 Power supply range

---

The normal test voltage for equipment to be connected to the mains shall be the nominal mains voltage. For the purpose of the present document, the nominal voltage shall be the declared voltage, or any of the declared voltages  $\pm 5\%$ , for which the equipment was designed.

## Section 6. Measurement uncertainty

---

### 6.1 Uncertainty of measurement

---

Nemko Canada Inc. has calculated measurement uncertainty and is documented in EMC/MUC/001 "Uncertainty in EMC measurements." Measurement uncertainty was calculated using the methods described in CISPR 16-4 Specification for radio disturbance and immunity measuring apparatus and methods – Part 4: Uncertainty in EMC measurements; as well as described in UKAS LAB34: The expression of Uncertainty in EMC Testing. Measurement uncertainty calculations assume a coverage factor of  $K=2$  with 95% certainty.

## Section 7. Test equipment

### 7.1 Test equipment list

*Table 7.1-1: Equipment list*

| Equipment                  | Manufacturer     | Model no.    | Asset no. | Cal cycle | Next cal.   |
|----------------------------|------------------|--------------|-----------|-----------|-------------|
| 3 m EMI test chamber       | TDK              | SAC-3        | FA002047  | 1 year    | Mar. 09/14  |
| Flush mount turntable      | Sunol            | FM2022       | FA002082  | —         | NCR         |
| Controller                 | Sunol            | SC104V       | FA002060  | —         | NCR         |
| Antenna mast               | Sunol            | TLT2         | FA002061  | —         | NCR         |
| Power supply               | California Inst. | 3001I        | FA001021  | 1 year    | May 20/14   |
| Receiver/spectrum analyzer | Rohde & Schwarz  | ESU 26       | FA002043  | 1 year    | May 30/14   |
| Spectrum analyzer          | Rohde & Schwarz  | FSU          | FA001877  | 1 year    | Jan 06/14   |
| Bilog antenna              | Sunol            | JB3          | FA002108  | 1 year    | Feb. 21/14  |
| Horn antenna #1            | EMCO             | 3115         | FA000649  | 1 year    | Mar. 25/14  |
| 1–18 GHz pre-amplifier     | JCA              | JCA118-503   | FA002091  | 1 year    | June 21/14  |
| Horn antenna 18–40 GHz     | EMCO             | 3116         | FA001847  | 1 year    | Sept. 06/13 |
| 26–40 GHz pre-amplifier    | Narda            | DBL-2640N610 | FA001556  | —         | VOU         |

Note: NCR - no calibration required, VOU - verify on use

## Section 8. Testing data

### 8.1 FCC 15.207(a) and RSS-Gen 7.2.4 AC power line conducted emissions limits

#### 8.1.1 Definitions and limits

##### FCC:

Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table, as measured using a 50  $\mu$ H/50  $\Omega$  line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

##### IC:

The purpose of this test is to measure unwanted radio frequency currents induced in any AC conductor external to the equipment which could conduct interference to other equipment via the AC electrical network.

Except when the requirements applicable to a given device state otherwise, for any licence-exempt radiocommunication device equipped to operate from the public utility AC power supply, either directly or indirectly, the radio frequency voltage that is conducted back onto the AC power lines in the frequency range of 0.15 MHz to 30 MHz shall not exceed the limits shown in Table 2. The tighter limit applies at the frequency range boundaries.

The conducted emissions shall be measured with a 50  $\Omega$ /50  $\mu$ H line impedance stabilization network (LISN).

**Table 8.1-1: Conducted emissions limit**

| Frequency of emission<br>(MHz) | Conducted limit (dB $\mu$ V) |           |
|--------------------------------|------------------------------|-----------|
|                                | Quasi-peak                   | Average   |
| 0.15–0.5                       | 66 to 56*                    | 56 to 46* |
| 0.5–5                          | 56                           | 46        |
| 5–30                           | 60                           | 50        |

Note: \* - Decreases with the logarithm of the frequency.

#### 8.1.2 Test summary

|               |                 |                   |           |
|---------------|-----------------|-------------------|-----------|
| Test date     | June 19, 2013   | Temperature       | 24 °C     |
| Test engineer | Andrey Adelberg | Air pressure      | 1008 mbar |
| Verdict       | Pass            | Relative humidity | 30 %      |

### 8.1.3 Observations, settings and special notes

---

The EUT was set up as tabletop configuration.

The spectral scan has been corrected with transducer factors (i.e. cable loss, LISN factors, and attenuators) for determination of compliance.

A preview measurement was generated with the receiver in continuous scan mode. Emissions detected within 6 dB or above limit were re-measured with the appropriate detector against the correlating limit and recorded as the final measurement.

Receiver settings for preview measurements:

|                       |                  |
|-----------------------|------------------|
| Resolution bandwidth: | 9 kHz            |
| Video bandwidth:      | 30 kHz           |
| Detector mode:        | Peak and Average |
| Trace mode:           | Max Hold         |
| Measurement time:     | 1000 ms          |

Receiver settings for final measurements:

|                       |                        |
|-----------------------|------------------------|
| Resolution bandwidth: | 9 kHz                  |
| Video bandwidth:      | 30 kHz                 |
| Detector mode:        | Quasi-Peak and Average |
| Trace mode:           | Max Hold               |
| Measurement time:     | 1000 ms                |

Plot 8.1-2: Conducted emissions on neutral line

## 8.2 FCC 15.247(a)(2) and RSS-210 A8.2(a) Minimum 6 dB bandwidth for systems using digital modulation techniques

### 8.2.1 Definitions and limits

#### FCC and IC:

- (a) Operation under the provisions of this Section is limited to frequency hopping and digitally modulated intentional radiators that comply with the following provisions:
- (2) Systems using digital modulation techniques may operate in the 902–928 MHz, 2400–2483.5 MHz and 5725–5850 MHz bands. The minimum 6 dB bandwidth shall be at least 500 kHz.

### 8.2.2 Test summary

|                |                 |                    |           |
|----------------|-----------------|--------------------|-----------|
| Test date:     | June 28, 2013   | Temperature:       | 23 °C     |
| Test engineer: | Andrey Adelberg | Air pressure:      | 1005 mbar |
| Verdict:       | Pass            | Relative humidity: | 36 %      |

### 8.2.3 Observations, settings and special notes

#### Spectrum analyser settings:

|                       |  |
|-----------------------|--|
| Resolution bandwidth: | 1–5 % of DTS BW (no wider than 100 kHz)              |
| Video bandwidth:      | ≥3 × RBW   |
| Frequency span:       | 30 MHz for 20 MHz channel; 60 MHz for 40 MHz channel |
| Detector mode:        | Peak   |
| Trace mode:           | Max Hold   |

### 8.2.4 Test data

**Table 8.2-1: 6 dB bandwidth results**

| Antenna chain | Modulation   | Frequency, MHz | 6 dB bandwidth, MHz | Minimum limit, MHz | Margin, MHz |
|---------------|--------------|----------------|---------------------|--------------------|-------------|
| ch0           | 802.11a      | 5745           | 16.56               | 0.50               | 16.06       |

|               |              | 5785           | 36.63               | 0.50               | 36.13       |
|               |              | 5815           | 36.67               | 0.50               | 36.17       |

### 8.3 RSS-Gen 4.6.1 Occupied bandwidth

#### 8.3.1 Definitions and limits

When an occupied bandwidth value is not specified in the applicable RSS, the transmitted signal bandwidth to be reported is to be its 99 percent emission bandwidth, as calculated or measured.

The transmitter shall be operated at its maximum carrier power measured under normal test conditions.

The span of the analyzer shall be set to capture all products of the modulation process, including the emission skirts. The resolution bandwidth shall be set to as close to 1 percent of the selected span as is possible without being below 1 percent. The video bandwidth shall be set to 3 times the resolution bandwidth. Video averaging is not permitted. Where practical, a sampling detector shall be used since a peak or, peak hold, may produce a wider bandwidth than actual.

The trace data points are recovered and are directly summed in linear terms. The recovered amplitude data points, beginning at the lowest frequency, are placed in a running sum until 0.5 percent of the total is reached and that frequency recorded. The process is repeated for the highest frequency data points. This frequency is recorded.

The span between the two recorded frequencies is the occupied bandwidth.

#### 8.3.2 Test summary

## 8.4 FCC 15.247(b) and RSS-210 A8.4 (4) Transmitter output power and e.i.r.p. requirements

### 8.4.1 Definitions and limits

**FCC:**

- (b) The maximum peak conducted output power of the intentional radiator shall not exceed the following:
- (3) For systems using digital modulation in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz bands: 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power. Maximum Conducted Output Power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power level. If multiple modes of operation are possible (e.g., alternative modulation methods), the maximum conducted output power is the highest total transmit power occurring in any mode.
- (4) The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

Fixed, point-to-point operation, as used in paragraphs (b)(3)(i) and (b)(3)(ii) of this section, excludes the use of point-to-multipoint systems, omnidirectional applications, and multiple co-located intentional radiators transmitting the same information. The operator of the spread spectrum intentional radiator or, if the equipment is professionally installed, the installer is responsible for ensuring that the system is used exclusively for fixed, point-to-point operations. The instruction manual furnished with the intentional radiator shall contain language in the installation instructions informing the operator and the installer of this responsibility.

- (c) Operation with directional antenna gains greater than 6 dBi.
- (1) Fixed point-to-point operation:
- (ii) Systems operating in the 5725–5850 MHz band that are used exclusively for fixed, point-to-point operations may employ transmitting antennas with directional gain greater than 6 dBi without any corresponding reduction in transmitter conducted output power.
- (iii) Fixed, point-to-point operation, as used in paragraphs (c)(1)(i) and (c)(1)(ii) of this section, excludes the use of point-to-multipoint systems, omnidirectional applications, and multiple co-located intentional radiators transmitting the same information. The operator of the spread spectrum or digitally modulated intentional radiator or, if the equipment is professionally installed, the installer is responsible for ensuring that the system is used exclusively for fixed, point-to-point operations. The instruction manual furnished with the intentional radiator shall contain language in the installation instructions informing the operator and the installer of this responsibility.

**IC:**

A8.4 (4) Transmitter Output Power and e.i.r.p. Requirements for systems employing digital modulation techniques operating in the bands 902–928 MHz, 2400–2483.5 MHz and 5725–5850 MHz bands

For systems employing digital modulation techniques operating in the bands 902–928 MHz, 2400–2483.5 MHz and 5725–5850 MHz, the maximum peak conducted output power shall not exceed 1 W. Except as provided in Section A8.4(5), the e.i.r.p. shall not exceed 4 W.

As an alternative to a peak power measurement, compliance can be based on a measurement of the maximum conducted output power (see RSS-Gen).

### 8.4.2 Test summary

|                |                 |                    |           |
|----------------|-----------------|--------------------|-----------|
| Test date:     | July 2, 2013    | Temperature:       | 22 °C     |
| Test engineer: | Andrey Adelberg | Air pressure:      | 1008 mbar |
| Verdict:       | Pass            | Relative humidity: | 32 %      |

### 8.4.3 Observations, settings and special notes

The test was performed according to DTS guidelines section 9.2.2.2, method AVGSA-1: maximum conducted (average) output power with trace averaging. The EUT was set to transmit with 100% duty cycle.

Spectrum analyzer settings were as follows:

|                       |                                       |
|-----------------------|---------------------------------------|
| Span:                 | 1.5 times the OBW                     |
| Resolution bandwidth: | 1–5 % of the OBW, not to exceed 1 MHz |
| Video bandwidth:      | $\geq 3 \times \text{RBW}$            |
| Detector mode:        | RMS                                   |
| Trace mode:           | Power averaging over 100 traces       |

Combined average output power for MIMO  $2 \times 2$  application was calculated as follows:  $P_{combined} = 10 \times \log_{10} \left( (10^{P_{ch0}/10}) + (10^{P_{ch1}/10}) \right)$

Directional gain for MIMO Correlated  $2 \times 2$  (CDD/TXBF) with 6.7 dBi antenna = 6.7 dBi +  $10 \times \log_{10}(N)$  dB = 6.7 dBi + 3 dB = 9.7 dBi, where “N” is number of antennae. Output power limit was calculated as follows:  $30 - (9.7 - 6) = 26.3$  dBm

Directional gain for MIMO Uncorrelated (cross polarized)  $2 \times 2 = 11.5$  dBi. Output power limit was calculated as follows:  $30 - (11.5 - 6) = 24.5$  dBm

Directional gain for MIMO Uncorrelated (cross polarized)  $2 \times 2 = 12$  dBi. Output power limit was calculated as follows:  $30 - (12 - 6) = 24$  dBm

### 8.4.4 Test data

**Table 8.4-1:** Output power measurements and EIRP calculations results for MIMO  $2 \times 2$  with 6.7 dBi antenna configuration

**Figure 8.4-3:** Output power on 802.11n HT40, sample plot

Note: plots provided here are to show spectrum analyzer settings only. The results shown on the plots do not always represent the final measurement results. Final results are in the tables 8.4–1 to 8.4–3.

## 8.5 FCC 15.247(d) and RSS-210 A8.5 Spurious (out-of-band) emissions

### 8.5.1 Definitions and limits

#### FCC:

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

#### IC:

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the radio frequency power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under Section A8.4(4), the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in Tables 2 and 3 is not required.

**Table 8.5-1: FCC §15.209 and RSS-Gen – Radiated emission limits**

| Frequency,<br>MHz | Field strength of emissions |                                 | Measurement distance, m |
|-------------------|-----------------------------|---------------------------------|-------------------------|
|                   | µV/m                        | dBµV/m                          |                         |
| 0.009–0.490       | 2400/F                      | $67.6 - 20 \times \log_{10}(F)$ | 300                     |
| 0.490–1.705       | 24000/F                     | $87.6 - 20 \times \log_{10}(F)$ | 30                      |
| 1.705–30.0        | 30                          | 29.5                            | 30                      |
| 30–88             | 100                         | 40.0                            | 3                       |
| 88–216            | 150                         | 43.5                            | 3                       |
| 216–960           | 200                         | 46.0                            | 3                       |
| above 960         | 500                         | 54.0                            | 3                       |

Notes: In the emission table above, the tighter limit applies at the band edges.

For frequencies above 1 GHz the limit on peak RF emissions is 20 dB above the maximum permitted average emission limit applicable to the equipment under test

**Table 8.5-2: FCC and IC (combined) restricted frequency bands**

| MHz               | MHz                 | MHz           | GHz         |
|-------------------|---------------------|---------------|-------------|

| Test engineer: | Andrey Adelberg | Air pressure:      | 1006 mbar |
| Verdict:       | Pass            | Relative humidity: | 33 %      |

## 8.5.3 Observations/special notes

The spectrum was searched from 30 MHz to 40 GHz.

EUT was set to transmit with 100 % duty cycle.

Radiated measurements were performed at a distance of 3 m, the EUT was transmitting on both MIMO chains simultaneously. Both antenna ports were terminated with 50  $\Omega$  load. **No radiated emissions falling within restricted bands above system noise floor were detected.**

Since fundamental power was tested using average method, the spurious emissions outside restricted bands limit is -30 dBc/100 kHz

Average conducted spurious emissions limit for frequencies above 1 GHz that fall within restricted bands was calculated as follows:

54 dB $\mu$ V/m - 95.23 dB - 3 dB - 9.7 dBi = -53.93dBm (for 6.7 dBi configuration), where 3 dB is a two-antenna-port compensation factor ( $10 \times \log_{10}(2)$ );

54 dB $\mu$ V/m - 95.23 dB - 3 dB - 11.5 dBi = -55.73dBm (for 11.5 dBi configuration);

54 dB $\mu$ V/m - 95.23 dB - 3 dB - 12.0 dBi = -56.23dBm (for 12.0 dBi configuration).

For frequencies below 1 GHz that fall within restricted bands, -4.7 dB additional ground reflection factor was added.

Peak conducted spurious emissions limit for frequencies that fall within restricted bands is 20 dB greater than the average limits shown above.

Spectrum analyser settings for **radiated** measurements **within restricted bands** below 1 GHz:

|                       |          |
|-----------------------|----------|
| Resolution bandwidth: | 100 kHz  |
| Video bandwidth:      | 300 kHz  |
| Detector mode:        | Peak     |
| Trace mode:           | Max Hold |

Spectrum analyser settings for **radiated** measurements **within restricted bands** above 1 GHz:

|                       |                               |
|-----------------------|-------------------------------|
| Resolution bandwidth: | 1 MHz                         |
| Video bandwidth:      | 3 MHz (peak); 10 Hz (average) |
| Detector mode:        | Peak                          |
| Trace mode:           | Max Hold                      |

Spectrum analyser settings for **conducted** spurious emissions measurements **outside restricted bands**:

|                       |          |
|-----------------------|----------|
| Resolution bandwidth: | 100 kHz  |
| Video bandwidth:      | 300 kHz  |
| Detector mode:        | Peak     |
| Trace mode:           | Max Hold |

Spectrum analyser settings for peak **conducted** spurious emissions measurements **within restricted bands**:

|                       |          |
|-----------------------|----------|
| Resolution bandwidth: | 1 MHz    |
| Video bandwidth:      | 3 MHz    |
| Detector mode:        | Peak     |
| Trace mode:           | Max Hold |

Spectrum analyser settings for average **conducted** spurious emissions measurements **within restricted bands**:

|                       |                                 |
|-----------------------|---------------------------------|
| Resolution bandwidth: | 1 MHz                           |
| Video bandwidth:      | 10 MHz                          |
| Detector mode:        | RMS                             |
| Trace mode:           | Power averaging over 100 sweeps |

#### 8.5.4 Test data

**Table 8.5-3:** Conducted spurious emissions within restricted bands. Results for 802.11a and MIMO 2 × 2 at cho.

| Channel | Frequency,<br>MHz | Peak power, dBm |        | Margin,<br>dB | Average power, dBm |        | Margin,<br>dB |
|---------|-------------------|-----------------|--------|---------------|--------------------|--------|---------------|
|         |                   | Measured        | Limit  |               | Measured           | Limit  |               |

## 8.6 FCC 15.247(e) and RSS-210 A8.2(b) Power spectral density for digitally modulated devices

### 8.6.1 Definitions and limits

#### FCC:

For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of paragraph (b) of this section. The same method of determining the conducted output power shall be used to determine the power spectral density.

#### IC:

The transmitter power spectral density conducted from the transmitter to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission or over 1.0 second if the transmission exceeds 1.0-second duration. This power spectral density shall be determined in accordance with the provisions of Section A8.4(4); (i.e. the power spectral density shall be determined using the same method for determining the conducted output power).

### 8.6.2 Test summary

|                |                 |                    |           |
|----------------|-----------------|--------------------|-----------|
| Test date:     | July 3, 2013    | Temperature:       | 23 °C     |
| Test engineer: | Andrey Adelberg | Air pressure:      | 1006 mbar |
| Verdict:       | Pass            | Relative humidity: | 34 %      |

### 8.6.3 Observations, settings and special notes

The test was performed using method described in section 10.3 AVGPDS-1 of the 558074 D01 DTS Meas Guidance v03r01.

Spectrum analyser settings:

|                       |  |
|-----------------------|--|
| Resolution bandwidth: | 3–100 kHz  |
| Video bandwidth:      | 1 MHz  |
| Frequency span:       | 30 MHz (1.5 × DTS channel BW for 802.11a and 802.11n HT20) and to 56 MHz (1.5 × DTS channel BW for 802.11n HT40) |
| Detector mode:        | RMS  |
| Trace mode:           | Power averaging over 100 sweeps  |

Combined PSD for MIMO 2 × 2 application was calculated as follows:  $PSD_{combined} = 10 \times \log_{10} \left( (10^{PSD_{ch0}/10}) + (10^{PSD_{ch1}/10}) \right)$

### 8.6.4 Test data

**Table 8.6-1: PSD measurements results**

| Modulation   | Frequency, MHz | Measured power spectral density, dBm/100 kHz |        |          | PSD limit, dBm/3 kHz | Margin, dB |
|--------------|----------------|--|--------|----------|----------------------|------------|
|              |                | On ch0                                       | On ch1 | Combined |                      |            |
| 802.11a      | 5745           | -2.65  | -2.73  | 0.32     | 8.00                 | 7.68       |
|              | 5785           | -0.32  | -2.00  | 1.93     | 8.00                 | 6.07       |
|              | 5825           | -0.68  | -1.13  | 2.11     | 8.00                 | 5.89       |
| 802.11n HT20 | 5745           | -2.97  | -3.02  | 0.02     | 8.00                 | 7.98       |
|              | 5785           | -0.69  | -2.15  | 1.65     | 8.00                 | 6.35       |
|              | 5825           | -1.08  | -1.04  | 1.95     | 8.00                 | 6.05       |
| 802.11n HT40 | 5755           | -6.23  | -7.31  | -3.73    | 8.00                 | 11.73      |
|              | 5785           | -2.99  | -4.95  | -0.85    | 8.00                 | 8.85       |
|              | 5815           | -3.87  | -5.84  | -1.73    | 8.00                 | 9.73       |
