

Power input, the main control IC XL1024 drives the MOSFET (Drive Circuit), the MOSFET push-pull capacitor resonates with the inductor, and the oscillation power of 50V voltage is 105-189K. The communication module detects and receives the feedback information to MCU, and the modulation frequency of the feedback information is 500-1000Hz. At the same time, the electrical detection module will send the transmitting power back to MCU, and MCU will adjust the transmitting frequency according to the feedback information to make the circuit control within a certain range.
