## 1.0 Job Description

### 1.1 Client Information

This EUT has been tested at the request of

**Company:** Vanu, Inc.  
One Cambridge Center  
Cambridge, MA 02142

**Contact:** Byron Kubert  
**Telephone:** 617-864-1711  
**Fax:** 617-864-1697

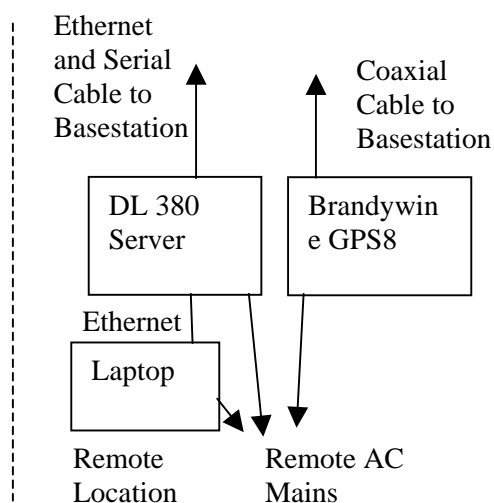

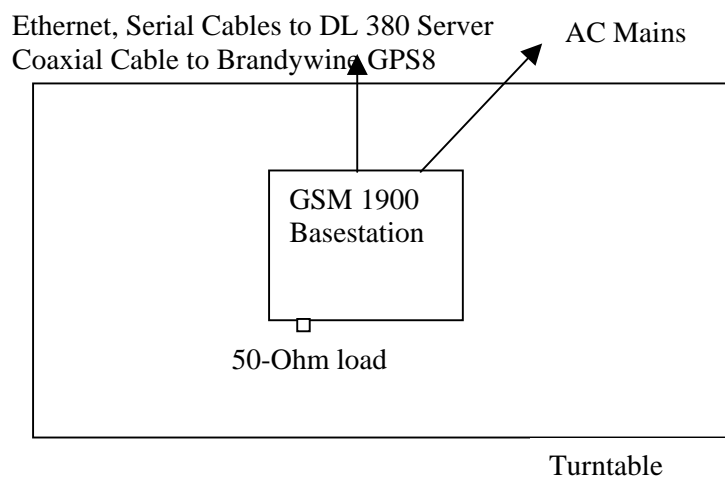

### 1.2 Equipment Under Test

**Equipment Type:** Cellular Basestation  
**Model Number(s):** GSM 1900 Basestation  
**Serial number(s):** 1526-1  
**Manufacturer:** Protium Technologies, Inc.  
**EUT receive date:** 08/15/2005  
**EUT received condition:** Good  
**Test start date:** 08/15/2005  
**Test end date:** 09/09/2005

**1.3 Test Plan Reference:** Tested according to the standards listed.

### 1.4 Test Configuration

#### 1.4.1 Block Diagram

#### 1.4.2 Cable List:

| Cable                  | Shielding | Connector       | Length (m) | Qty. |
|------------------------|-----------|-----------------|------------|------|
| DL380 Power Cable      | None      | Plastic         | 1.5        | 1    |
| Serial Cable           | Braid     | Metal/360 (DB9) | 3          | 1    |
| Ethernet Cable         | Braid     | Metal           | 1.5        | 2    |
| RF Section Power Cable | None      | Plastic         | 2          | 1    |
| Laptop Power Cable     | Braid     | Metal/Jack      | 2.5        | 1    |
| Brandywine Power Cable | None      | Plastic         | 2.5        | 1    |
| Coaxial Cable          | Braid     | Metal/360 (BNC) | 2          | 1    |

#### 1.4.3 Support Equipment:

Name: Dell Latitude Laptop  
 Model No.: D505  
 Serial No.: 1541

Name: Brandywine Communications  
 Model No.: GPS8  
 Serial No.: 1611

Name: HP ProLiant DL 380 Server  
 Model No.: DL380  
 Serial No.: 1205

## 1.5 Mode of Operation:

The EUT was activated from 120V/60Hz power and transmitted on low, mid, and high channels across the EUT passband. Various types of data were fed to the modulator, as indicated in the list below and referenced elsewhere in this document. Unless otherwise indicated, bursts of random data were fed to the modulator.

EUT passband: 1930 – 1990 MHz

Channels Tested:

Channel A: 1931 MHz

Channel B: 1960 MHz

Channel C: 1989 MHz

BIT PATTERN TEST MODES (All Software Tests performed at Channel B – 1960 MHz)

|                  |  |
|------------------|--|
| Software Test 1  | Repeated GSM signal syncburst dropout filling every other page with zeros  |
| Software Test 2  | GSM signal program suspended for seconds at a time every couple of seconds   |
| Software Test 3  | GSM signal created from a sequence of all zeros (156 zeros)  |
| Software Test 4  | Repeated GSM signal with 8 bursts of valid traffic channel data followed by 8 bursts of zeros                                      |
| Software Test 5  | Repeated GSM signal with 1 timeslot of valid traffic channel data and remaining 7 timeslots filled with dummy bursts               |
| Software Test 6  | Repeated GSM signal sequence with 4 timeslots of valid traffic channel data and the remaining 4 timeslots filled with dummy bursts |
| Software Test 7  | Repeated GSM signal sequence with 8 timeslots of valid traffic channel data  |
| Software Test 8  | GSM signal created from a square wave with a period of four symbols  |
| Software Test 9  | GSM signal created from a random sequence of 125000 symbols  |
| Software Test 10 | GSM signal created from a sequence of all ones (156 ones)  |
| Software Test 11 | Repeated GSM signal with 1 timeslot of valid control channel data and remaining 7 timeslots filled with dummy bursts               |

## 2.0 Test Summary

| TEST STANDARD                                      | RESULTS   |         |
|--|---|---------|
| FCC Part 24  |   |         |
| SUB-TEST   | TEST PARAMETER  | COMMENT |
| RF Output Power<br>FCC 2.1046, 24.232              | RF Output Power must not exceed 100 Watts (50 dBm)      | Pass    |
| Occupied Bandwidth<br>FCC 2.1049                   | Emission must stay within assigned band of operation.   | Pass    |
| Spurious Conducted Emissions<br>FCC 2.1051, 24.238 | Emissions outside the passband must not exceed -13 dBm. | Pass    |
| Spurious Radiated Emissions<br>FCC 2.1053, 24.238  | Emissions outside the passband must not exceed -13 dBm. | Pass    |
| Frequency Stability<br>FCC 2.1055, 24.235          | Emission must stay within assigned band of operation.   | Pass    |

### 3.0 Sample Calculations

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG$$

Where  
 FS = Field Strength in dBμV/m  
 RA = Receiver Amplitude (including preamplifier) in dBμV  
 CF = Cable Attenuation Factor in dB  
 AF = Antenna Factor in dB  
 AG = Amplifier Gain in dB

In the following table(s), the reading shown on the data table reflects the preamplifier gain. An example for the calculations in the following table is as follows.

Assume a receiver reading of 52.0 dBμV is obtained. The antenna factor of 7.4 dB and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving a field strength of 32 dBμV/m. This value in dBμV/m was converted to its corresponding level in μV/m.

$$\begin{aligned} RA &= 52.0 \text{ dB}\mu\text{V} \\ AF &= 7.4 \text{ dB/m} \\ CF &= 1.6 \text{ dB} \\ AG &= 29.0 \text{ dB} \\ FS &= 32 \text{ dB}\mu\text{V/m} \end{aligned}$$

$$\text{Level in } \mu\text{V/m} = [10(32 \text{ dB}\mu\text{V/m})/20] = 39.8 \mu\text{V/m}$$

The following is how net line-conducted readings were determined:

$$NF = RF + LF + CF + AF$$

Where NF = Net Reading in dBμV  
 RF = Reading from receiver in dBμV  
 LF = LISN Correction Factor in dB  
 CF = Cable Correction Factor in dB  
 AF = Attenuator Loss Factor in dB

To convert from dBμV to μV or mV the following was used:

$$UF = 10^{(NF/20)} \text{ where } UF = \text{Net Reading in } \mu\text{V}$$

#### Example:

$$\begin{aligned} NF &= RF + LF + CF + AF = 28.5 + 0.2 + 0.4 + 20.0 = 49.1 \text{ dB}\mu\text{V} \\ UF &= 10^{(49.1 \text{ dB}\mu\text{V} / 20)} = 254 \mu\text{V/m} \end{aligned}$$

### 3.1 Measurement Uncertainty

Compliance of the product is based on the measured value. However, the measurement uncertainty is included for informational purposes.

The expanded uncertainty ( $k = 2$ ) for radiated emissions from 30 to 1000 MHz has been determined to be:  
 $\pm 3.5$  dB at 10m,  $\pm 3.8$  dB at 3m

The expanded uncertainty ( $k = 2$ ) for mains conducted emissions from 150 kHz to 30 MHz has been determined to be:

$\pm 2.6$  dB

The expanded uncertainty ( $k = 2$ ) for telecom port conducted emissions from 150 kHz to 30 MHz has been determined to be:

$\pm 3.2$  for ISN and voltage probe measurements

$\pm 3.1$  for current probe measurements

### 3.2 Site Description

#### Test Site(s): 2

Our OATS are 3m and 10m sheltered emissions measurement ranges located in a light commercial environment in Boxborough, Massachusetts. They meet the technical requirements of ANSI C63.4-1992 and CISPR 22:1993/EN 55022:1994 for radiated and conducted emission measurements. The shelter structure is entirely fiberglass and plastic, with outside dimensions of 33 ft x 57 ft. The structure resembles a quonset hut with a center ceiling height of 16.5 ft.

The testing floor is covered by a galvanized sheet metal groundplane that is earth-grounded via copper rods around the perimeter of the site. The joints between individual metal sheets are bridged with a 2 inch wide metal strips to provide low RF impedance contact throughout. The sheets are screwed in place with stainless steel, round-head screws every three inches. Site illumination and HVAC are provided from beneath the ground reference plane through flush entry ports, the port covers are electrically bonded to the ground plane.

A flush metal turntable with 12 ft. diameter and 5000 lb. load capacity (12,000 lb. in Site 3) is provided for floor-standing equipment. A wooden table 80 cm high is used for table-top equipment. The turntable is electrically connected to the ground plane with three copper straps. The straps are connected to the turntable at the center of it with ground braid. The copper strap is directly connected to the groundplane at the edges of the turntable. The turntable is located on the south end of the structure and the antennas are mounted 3 and 10 meters away to the north. The antenna mast is a non-conductive with remote control of antenna height and polarization. The antenna height is adjustable from 1 to 4 meters.

All final radiated emission measurements are performed with the testing personnel and measurement equipment located below the ground reference plane. The site has a full basement underneath the turntable where support equipment may be remotely located. Operation of the antenna, turntable and equipment under test is controlled by remote controls that manipulate the antenna height and polarization and with a turntable control. Test personnel are located below the ellipse when measurements are performed, however the site maintains the ability of having personnel manipulate cables while monitoring test equipment. Ambient radiated emissions are 6 dB or more below the relevant FCC emission limits.

AC mains power is brought to the equipment under test through a power line filter, to remove ambient conducted noise. 50 Hz (240 VAC single phase), 60 Hz power (120 VAC single phase, 208 VAC three phase), and 60 Hz (480 VAC three phase) are available. Conducted emission measurements are performed with a Line Impedance Stabilization Network (LISN) or Artificial Mains Network (AMN) bonded to the ground reference plane. A removable vertical groundplane (2 meter X 2 meter area) is used for line-conducted measurements for table top equipment. The vertical groundplane is electrically connected to the reference groundplane.

The EMC Lab has two Semi-anechoic Chambers and one Shielded Chamber. AC Mains Power is available at 120, 230, and 277 Single Phase; 208, 400, and 480 3-Phase. Large reference groundplanes are installed in the general lab area to facilitate EMC work not requiring a shielded environment.

**Test Results:** Pass

**Test Details:**

The EUT was tested without an amplifier, at the output of the duplexer. While the limit on spurious emissions is -13 dBm, plots were taken with a display line located 63 dB down from the -13 dBm limit, in order to establish the level of spurious emissions for the purposes of determining allowable amplifier gain, required filtration, and maximum output power at the time of licensing. Since the measuring equipment noise floor sometimes exceeds the -76 dBm display line, plots were taken with 100 kHz bandwidth to show whether there are emissions located in these frequency ranges. Plots were then taken using 1 MHz bandwidth for the purposes of showing compliance with the limit and the actual signal level of any spurious detected. Delta markers were placed at spurious peaks detected in order to show dBc values. Note that in the 30-1000 MHz plots, the marker shown has been placed in the noise floor to show the noise floor signal level. In the 1-20 GHz plots, marker 2 is similarly placed at the highest point of the noise floor of the measuring equipment. The only spurious emission detected was the 2<sup>nd</sup> harmonic of the EUT fundamental, all other peaks are transient noise floor spikes. Modes tested include low, mid, and high channels as well as 3 tone continuous-wave intermodulation product tests with two of the three tones alternately at the low and the high end of the passband. The intermodulation product test was performed twice because the EUT can only generate channels with a maximum separation of 26 MHz.

Notes: Transducer factors were programmed into the spectrum analyzer to compensate for cable loss in the test setup. Software test mode plots can be found in Appendix C.

Notes: The EUT was tested with a 50-Ohm load at the antenna port. Modes tested include low, mid, and high channels as well as 3 tone continuous-wave intermodulation product tests with two of the three tones alternately at the low and the high end of the passband. The intermodulation product test was performed twice because the EUT can only generate channels with a maximum separation of 26 MHz. No emissions were observed above 1125 MHz, so noise floor readings were taken instead. The substitution method was used to convert spurious field strength values to ERP.

**Setup Photos**

**Test Results:** Pass

**Test Standard:** FCC 2.1055, 24.235

**Test:** Frequency Stability

**Maximum Test Disturbance Parameters:** Emission must stay within assigned band of operation.  
**Software:**

**Test Date:** 08/17/2005

**Engineer Initials:** \_\_\_\_\_ **Date:** \_\_\_\_\_

**Test Engineer:** Nicholas Abbondante

**Reviewer Initials:** \_\_\_\_\_ **Date:** \_\_\_\_\_

Notes: A continuous wave signal was used for this test. The maximum frequency deviation measured is 700 Hertz. The maximum occupied bandwidth measured is 285.6 kHz. Given that the nearest channels to the band edges are located at 1931.000288 and 1989.000313 MHz, even in a case where the entire occupied bandwidth of the signal is located to the left or to the right of the fundamental frequency, the 26 dB down points of the EUT waveform will never be closer than 713.7 kHz from the band edges.
