TEST REPORT

For

77G Side Radar

Model: ARS-DA03

Trade Name: ALPHA

Issued to

Alpha Networks Inc.

No. 8, Li-Hsin 7th Rd., Hsinchu Science Park, Hsinchu 300094, Taiwan

Issued by

Compliance Certification Services Inc.

Wugu Laboratory

No.11, Wugong 6th Rd., Wugu Dist.,

New Taipei City, Taiwan.

Issued Date: December 31, 2024

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only.
除非另有說明，此報告結果僅對測試之樣品負責，同時此樣品僅保留90天。本報告未經本公司書面許可，不可部份複製。

This document is issued by the Company subject to its General Conditions of Service printed overleaf, available on request or accessible at <http://www.sgs.com.tw/Terms-and-Conditions> and, for electronic format documents, subject to Terms and Conditions for Electronic Documents at <http://www.sgs.com.tw/Terms-and-Conditions>. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Any holder of this document is advised that information contained hereon reflects the Company's findings at the time of its intervention only and within the limits of client's instruction, if any. The Company's sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents. This document cannot be reproduced, except in full, without prior written approval of the Company. Revision History

Rev.	Issue Date	Revisions	Effect Page	Revised By
00	October 4, 2024	Initial Issue	ALL	Allison Chen
01	December 09, 2024	See the following Note Rev.(01)	P.5, 9-10, 16, 19-20, 22, 29-32, 34-36, 38-39, 45-46	Allison Chen
02	December 25, 2024	See the following Note Rev.(02)	P. 4-5, 8, 10-12, 15-16, 19, 20, 22, 45, 46	Allison Chen
03	December 30, 2024	See the following Note Rev.(03)	P.5	Allison Chen
04	December 31, 2024	See the following Note Rev.(04)	P.5	Allison Chen

Note:

Rev.(01)

1. Modify EUT description (DC current, frequency range, antenna designation, sweep characteristic) in section 2.
2. Modify measurement equipment used in section 5.2 and test program in section 7.4.
3. Modify test procedure, description, test data in section 8.1, 8.2 and 8.4.

Rev.(02)

1. Modify date of test in section 1.
2. Modify EUT description (power supply, antenna designation) in section 2.
3. Modify description of test modes in section 4.4 and measurement equipment used in section 5.2.
4. Modify support equipment and test setup diagram(s) in section 7.2 and 7.3.
5. Modify far field condition for EUT and test data in section 8.1
6. Modify test data in section 8.4.

Rev.(03)

1. Modify EUT description (frequency range, antenna designation) in section 2.

Rev.(04)

1. Modify EUT description (antenna designation) in section 2.

1. TEST RESULT CERTIFICATION

Applicant: Alpha Networks Inc.
No. 8, Li-Hsin 7th Rd., Hsinchu Science Park, Hsinchu 300094,
Taiwan
Equipment Under Test: 77G Side Radar
Trade Name: ALPHA
Model: ARS-DA03
Date of Test: July 29 ~ December 13, 2024

APPLICABLE STANDARDS	
STANDARD	TEST RESULT
FCC 47 CFR Part 95 Subpart M	Compliance
Statements of Conformity	
Determination of compliance is based on the results of the compliance measurement, not taking into account measurement instrumentation uncertainty.	

We hereby certify that:

All test results conform to above mentioned standards.

The above equipment was tested by Compliance Certification Services Inc. The test data, data evaluation, test procedures, and equipment configurations shown in this report were made in accordance with the procedures given in ANSI C63.26: 2015 and the energy emitted by the sample EUT tested as described in this report is in compliance with the requirements of FCC Rules Part 95.3367, 95.3379 and FCC KDB 653005 D01.

The test results of this report relate only to the tested sample EUT identified in this report.

Approved by:

Sehni, Hu

Sehni Hu
Supervisor

2. EUT DESCRIPTION

Product	77G Side Radar
Trade Name	ALPHA
Model Number	ARS-DA03
Model Discrepancy	N/A
Received Date	June 13, 2024
Power Supply	Power from Adapter. CWT / 2ABN036F I/P: 100-240 Vac, 50/60 Hz, 1.0A O/P: 12.0 Vdc, 3.0A
DC current	280mA
Frequency Range	76.5-76.74 GHz
Modulation	FMCW
Number of Channel	1
Antenna Designation	Type: Patch Antenna (1) Antenna model: ARS-SA01B/TX1, Gain: 18.69 dBi ARS-SA01B/TX2, Gain: 17.75 dBi (2) Antenna model: ARS-SA07/TX5, Gain: 11.09 dBi ARS-SA07/TX6, Gain: 11.94 dBi
H.W: Version	ARS-SA01B: 2A4G, ARS-SA07: 1A1G
S.W Version	0000001620.56202
S/N	116M11O500043
Sweep Characteristics	Sweep Bandwidth: 240 MHz Sweep Rate: 100 Hz/s Sweep Time: 27 us

Remark:

1. The sample selected for test was production product and was provided by manufacturer.
2. Disclaimer: Antenna and sweep characteristics information is provided by the applicant, test results of this report are applicable to the sample EUT received.

3. TEST SUMMARY

Report Section	FCC Standard Section	Test Item	Result
8.1	§2.1046 95.3367	Equivalent Isotropically Radiated Power (EIRP)	Pass
8.2	§2.1053 95.3379(a)	Field Strength of Spurious Radiation	Pass
8.3	§2.1055 95.3379(b)	Frequency stability	Pass
8.4	§2.1049	Occupied bandwidth (99%)	Pass

4. TEST METHODOLOGY

The tests documented in this report were performed in accordance with ANSI C63.10: 2020, ANSI 63.26:2015 and FCC CFR 47 Part 95.3367, 95.3379, FCC KDB 653005 D01.

4.1 EUT CONFIGURATION

The EUT configuration for testing is installed on RF field strength measurement to meet the Commissions requirement and operating in a manner that intends to maximize its emission characteristics in a continuous normal application.

4.2 EUT EXERCISE

The EUT was operated in the engineering mode to fix the TX frequency that was for the purpose of the measurements.

4.3 GENERAL TEST PROCEDURES

Radiated Emissions

The EUT is placed on a turn table, which is 1.5 m above ground plane. The turntable shall rotate 360 degrees to determine the position of maximum emission level. EUT is set 3m away from the receiving antenna, which varied from 1m to 4m to find out the highest emission. And also, each emission was to be maximized by changing the polarization of receiving antenna both horizontal and vertical. In order to find out the maximum emissions, exploratory radiated emission measurements were made.

4.4 DESCRIPTION OF TEST MODES

The EUT (model: ARS-DA03) had been tested under operating condition.

Software used to control the EUT for staying in continuous transmitting mode was programmed.

Thermostat Test Room	
Test Condition	Thermostat test room
Power supply Mode	Mode 1: EUT power by Power supply
Worst Mode	☒ Mode 1 ☐ Mode 2 ☐ Mode 3 ☐ Mode 4

Radiated Emission Measurement Above 1G	
Test Condition	Radiated Emission Above 1G
Power supply Mode	Mode 1: EUT power by Adapter
Worst Mode	☒ Mode 1 ☐ Mode 2 ☐ Mode 3 ☐ Mode 4
Worst Position	☐ Placed in fixed position. ☐ Placed in fixed position at X-Plane (E2-Plane) ☐ Placed in fixed position at Y-Plane (E1-Plane) ☒ Placed in fixed position at Z-Plane (H-Plane)

Radiated Emission Measurement Below 1G	
Test Condition	Radiated Emission Below 1G
Power supply Mode	Mode 1: EUT power by Adapter
Worst Mode	☒ Mode 1 ☐ Mode 2 ☐ Mode 3 ☐ Mode 4

Remark:

1. The worst mode was record in this test report.
2. EUT pre-scanned in three axis ,X,Y, Z and two polarity, for radiated measurement. The worst case(Z-Plane) were recorded in this report

The sample supports two radars [Antenna model: ARS-SA01B and Antenna model: ARS-SA07] and has been fully evaluated for test items.

4.5 FAR FIELD CONDITION FOR FREQUENCY ABOVE 40GHZ

The equipment under test was transmitting while connected to its integral antenna and is placed on a turn table. The measurement antenna is in the far field of the EUT per formula $2D^2/\lambda$ where D is the larger between the dimension of the measurement antenna and the transmitting antenna of the EUT.

In this case, "D" is the largest dimension of the measurement antenna. The EUT is manipulated through all orthogonal planes representative of its typical use to achieve the highest reading on the receive spectrum analyzer.

Model	Frequency Range (GH)	Largest Dimension of the Horn Antenna (mm)	Minimum Test Distance Rm (m)
RCHO19R	40~60	31	0.38
RCHO12R	60~90	21	0.26
RCHO08R	90~140	15	0.21
RCHO05R	140~220	10	0.15
FH-PP-325	220~325	8	0.14

5. INSTRUMENT CALIBRATION

5.1 MEASURING INSTRUMENT CALIBRATION

The measuring equipment, which was utilized in performing the tests documented herein, has been calibrated in accordance with the manufacturer's recommendations for utilizing calibration equipment, which is traceable to recognized national standards.

5.2 MEASUREMENT EQUIPMENT USED

Equipment Used for Emissions Measurement

Remark: Each piece of equipment is scheduled for calibration once a year.

A	Test Kit	N/A	N/A	N/A	N/A
B	RS-232 Cable	N/A	N/A	N/A	N/A

Remark:

1. All the equipment/cables were placed in the worst-case configuration to maximize the emission during the test.
2. Grounding was established in accordance with the manufacturer's requirements and conditions for the intended use.

7.3 TEST SETUP DIAGRAM(S)

7.4 TEST PROGRAM

This EUT uses " Realterm_2.0.0.70 " software to set the frequency, modulation, and power to allow the sample to continuously transmit.

For power setting: the default value

8. TEST REQUIREMENTS

8.1 EQUIVALENT ISOTROPICALLY RADIATED POWER (EIRP)

LIMIT

The fundamental radiated emission limits within the 76-81 GHz band are expressed in terms of Equivalent Isotropically Radiated Power (EIRP) and are as follows:

According to FCC 95.3367.

The maximum power (EIRP) within the 76-81 GHz band shall not exceed 50 dBm based on measurements employing a power averaging detector with a 1 MHz Resolution Bandwidth (RBW).

The maximum peak power (EIRP) within the 76-81 GHz band shall not exceed 55 dBm based on measurements employing a peak detector with a 1 MHz RBW.

TEST CONFIGURATION

TEST PROCEDURE

Refer to ANSI C63.26-2015 Clause 5.2.7, KDB 653005 D01 76-81 GHz Radars v01r02
Connect the test antenna for the fundamental frequency band to a spectrum analyzer via an external mixer.

Set spectrum analyzer RBW, VBW, detector, span, and so on, to the proper values.
Maximize the fundamental emission, noting that multiple peaks may be found at different beam orientations and/or polarizations. A pulse desensitization factor must be applied to the measured peak pulse power amplitude.

Consult the relevant instrumentation manufacturers' Application Note(s) for more detailed information, including how to determine the magnitude of the FMCW- and pulse-desensitization factors.

Calculate the EIRP from the measured field strength using equation as follows:

For Peak Measurement:

$$\text{EIRP (dBm)} = E \text{ (dB}\mu\text{V/m)} + 20\log(D) - 104.8 + \text{Chirps Correction Factor}$$

For Average Measurement:

$$\text{EIRP (dBm)} = E \text{ (dB}\mu\text{V/m)} + 20\log(D) - 104.8$$

EIRP is the equivalent isotropically radiated power

E is the field strength of the emission at the measurement distance

D is the measurement distance

$$E \text{ (dB}\mu\text{V/m)} = \text{Reading(dB}\mu\text{V)} + \text{Factor(dB/m)}$$

TEST RESULTS

Compliance.

Temperature: 24.6~24.8°C **Test date:** July 29~December 13, 2024
Humidity: 57~58% RH **Tested by:** Tony Chao

Far Field Condition for EUT

Model	Frequency Range (GHz)	Largest Dimension of the Horn Antenna (mm)	Minimum Test Distance Rm (m)
ARS-SA01B	77.00	40.00	0.82

Note:

- Level=Reading+antenna factor+mixer loss+cable
EIRP=Level +20log(d)[d=1m]-104.77 - desensitization factor
- Follow Annex L of the C63.10-2020 standard.
FMCW desensitization factor =20 * Log(α)

$$\alpha = \frac{1}{\left(1 + \left[\left(\frac{2 \times \ln(2)}{\pi}\right)^2 \times \left(\frac{BW_{\text{Chirp}}}{T_{\text{Chirp}} \times RBW^2}\right)^2\right]\right)^{0.25}}$$

BW_{chirp} : follow report sec 2

T_{Chirp} : Follow manufacturer's declaration 27us

RBW :1MHz

Test Data

(1) Antenna model: ARS-SA01B

Duty

Duty Cycle On (ms)	Duty Cycle On+Off (ms)	Duty Cycle (%)	Duty Factor (dB)
4.25	100.00	4.25%	13.72

Note: The signal at the second altitude is another radar signal, so this signal is not evaluated.

Peak Power

RMS Power

(2) Antenna model: ARS-SA07

Duty

Duty Cycle On (ms)	Duty Cycle On+Off (ms)	Duty Cycle (%)	Duty Factor (dB)
4.25	100.00	4.25%	13.72

Note: The signal at the second altitude is another radar signal, so this signal is not evaluated.

Peak Power

RMS Power

8.2 SPURIOUS EMISSIONS

8.2.1 Radiated Emissions

LIMIT

1. According to FCC PART 95.3379(a), Radiated emissions below 40 GHz shall not exceed the field strength as shown in the following emissions table.

Frequency (MHz)	Field Strength (μV/m)	Measurement Distance (m)
0.009 - 0.490	2400/F(kHz)	300
0.490 - 1.705	24000/F(kHz)	30
1.705 – 30.0	30	30
30-88	100	3
88-216	150	3
216-960	200	3
Above 960	500	3

2. For radiated emissions outside the 76-81 GHz band between 40 GHz and 200 GHz from field disturbance sensors and radar systems operating in the 76-81 GHz band: 600 pW/cm² at a distance of 3 meters from the exterior surface of the radiating structure.
3. For radiated emissions above 200 GHz from field disturbance sensors and radar systems operating in the 76-81 GHz band: 1000 pW/cm² at a distance of 3 meters from the exterior surface of the radiating structure.

Notes:

Calculate correction

Power density (mW/m²)X 4π(r)²=P(mW)

P(mW)-20log(d)+104.77=dBuV/m

600 pW/cm²= -1.7dBm @ 3m = 93.54dBuV/m@3m

1000 pW/cm²= 0.5 dBm @ 3m = 95.76dBuV/m@3m

P: Power

r: measurement distance(m)

Field Strength = Reading + Factor
EIRP (dBm) = Field Strength (dBμV/m) + 20log(D) – 104.8
D is the measurement distance

$$EIRP_{Linear} = 10^{\left[\frac{(EIRP_{Log} - 30)}{10}\right]}$$

where

$EIRP_{Linear}$ is the equivalent isotropically radiated power, in watts
 $EIRP_{Log}$ is the equivalent isotropically radiated power, in dBm

$$PD = \frac{EIRP_{Linear}}{4\pi d^2}$$

where

PD is the power density at the distance specified by the limit, in W/m²
 $EIRP_{Linear}$ is the equivalent isotropically radiated power, in watts
 d is the distance at which the power density limit is specified, in m

The Specified distance is 3m.

TEST CONFIGURATION

9kHz ~ 30MHz

30MHz ~ 1 GHz

Above 1 GHz ~ 18GHz

18GHz ~ 40GHz

Above 40 GHz

TEST PROCEDURE

1. The EUT is placed on a turntable, Above 1 GHz is 1.5m and below 1 GHz is 0.8m above ground plane. The EUT Configured un accordance with ANSI C63.26: 2015, and the EUT set in a continuous mode.
2. The turntable shall be rotated for 360 degrees to determine the position of maximum emission level.
3. EUT is set 3m or 1m away from the receiving antenna, which is varied from 1m to 4m to find out the highest emissions.
4. Maximum procedure was performed on the six highest emissions to ensure EUT compliance.
5. And also, each emission was to be maximized by changing the polarization of receiving antenna both horizontal and vertical.
6. The system was investigated from 9kHz to 243 GHz.

During the radiated emission test, the Spectrum Analyzer Setup were set with the following configurations:

Frequency Range	RBW	Video B/W
9kHz-150kHz	300 Hz	1 kHz
150 kHz-30MHz	10 kHz	30 kHz
30MHz-1000MHz	100 kHz	300 kHz
1-40GHz	1 MHz	3 MHz
Above 40GHz	1 MHz	3 MHz

If the maximized peak measured value complies with under the QP/Average limit more than 6dB, then it is unnecessary to perform an QP/Average measurement.

7. Repeat above procedures until the measurements for all frequencies are complete.
8. No emission found between lowest internal used/generated frequency to 30MHz (9kHz~30MHz).
9. Radiated emission below 30MHz is measured in a 9m*6m*6m semi-ane choic chamber, the measurements correspond to those obtained at an open-field test site. There is a comparison data of both open-field test site and semi-Anechoic chamber, and the result came out very similar.

Below 1 GHz

8.3 FREQUENCY STABILITY

LIMIT

According to FCC 95.3379(b), Fundamental emissions must be contained within the frequency bands specified in this section during all conditions of operation. Equipment is presumed to operate over the temperature range -40 to $+85$ degrees Celsius with an input voltage variation of 85% to 115% of rated input voltage, unless justification is presented to demonstrate otherwise.

Test Configuration

TEST PROCEDURE

The equipment under test was connected to an external AC or DC power supply and input rated voltage. RF output was connected to a frequency counter or spectrum analyzer via feed through attenuators. The EUT was placed inside the temperature chamber. Set the spectrum analyzer RBW low enough to obtain the desired frequency resolution and measure EUT 20°C operating frequency as reference frequency. Turn EUT off and set the chamber temperature to -40°C . After the temperature stabilized for approximately 30 minutes recorded the frequency. Repeat step measure with 10°C increased per stage until the highest temperature of $+85^{\circ}\text{C}$ reached.

TEST RESULTS

Compliance.

8.4 OCCUPIED BANDWIDTH (99%)

According to FCC 2.1049

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured.
653005 D01 76-81 GHz Radars v01r02 clause 4 d)

The occupied bandwidth of the radar device shall be measured, reported, and shown to be fully contained within the designated 76-81 GHz frequency band under normal operating conditions as well as under those extreme ambient temperature and input voltage conditions as described in Section 2.1057.

TEST CONFIGURATION

TEST PROCEDURE

C63.26-2015, Clause 5.4.4

The OBW is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers are each equal to 0.5% of the total mean power of the given emission.

The following procedure shall be used for measuring (99%) power bandwidth:

- a) The spectrum analyzer center frequency is set to the nominal EUT channel center frequency. The frequency span for the spectrum analyzer shall be set wide enough to capture all modulation products including the emission skirts (typically a span of $1.5 \times$ OBW is sufficient).
- b) The nominal IF filter 3 dB bandwidth (RBW) shall be in the range of 1% to 5% of the anticipated OBW, and the VBW shall be set $\geq 3 \times$ RBW.
- c) Set the reference level of the instrument as required to prevent the signal amplitude from exceeding the maximum spectrum analyzer input mixer level for linear operation. See guidance provided in 4.2.3.

NOTE—Step a), step b), and step c) may require iteration to adjust within the specified tolerances.

- d) Set the detection mode to peak, and the trace mode to max-hold.
- e) If the instrument does not have a 99% OBW function, recover the trace data points and sum directly in linear power terms. Place the recovered amplitude data points, beginning at the lowest frequency, in a running sum until 0.5% of the total is reached. Record that frequency as the lower OBW frequency. Repeat the process until 99.5% of the total is reached and record that frequency as the upper OBW frequency. The 99% power OBW can be determined by computing the difference these two frequencies.
- f) The OBW shall be reported and plot(s) of the measuring instrument display shall be provided with the test report. The frequency and amplitude axis and scale shall be clearly labeled. Tabular data can be reported in addition to the plot(s).

TEST RESULTS

Compliance.
