

Cellphone-Mate, Inc.

EMC TEST REPORT FOR

Guardian4-A

Tested to The Following Standards:

FCC Part 90 Section 219
Class A Booster

Report No.: 104177-14

Date of issue: October 13, 2020

Test Certificate # 803.01

This report contains a total of 134 pages and may be reproduced in full only. Partial reproduction may only be done with the written consent of CKC Laboratories, Inc.

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the equipment provided by the client, tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

A handwritten signature in black ink that reads "Steve Behm".

Steve Behm
Director of Quality Assurance & Engineering Services
CKC Laboratories, Inc.

Test Facility Information

Our laboratories are configured to effectively test a wide variety of product types. CKC utilizes first class test equipment, anechoic chambers, data acquisition and information services to create accurate, repeatable and affordable test results.

TEST LOCATION(S):
CKC Laboratories, Inc.
1120 Fulton Place
Fremont, CA 94539

SUMMARY OF RESULTS

Standard / Specification: FCC Part(s) 90 Section 219 Class A Booster

Industrial Booster Basic Measurement Guidance KDB 935210 D05 v01r04, April 3, 2020.

Correlation Matrix and Results					
Guidance Sec #	Guidance Description	FCC Sec #	FCC Rule Description	Mods	Results
3.4	Input-versus-output signal comparison	2.1049/Part 90 Section 219 (a)	Occupied Band Width	NA	Pass
4.3	Out-of-band rejection	Part 90 Section 219 (b)	Frequency Bands	NA	Pass
4.4	Input-versus-output signal comparison and Out of Band Emissions	Part 90 Section 219 (b)	Out of Band Emission	Mod #1	Pass
4.5	Input/output power and amplifier/booster gain	Part 90 Section 219 (e)(1)	Power Limit	Mod #1	Pass
4.6	Noise figure measurements	Part 90 Section 219 (e)(2)	Noise Figure Limit	Mod #1	Pass
4.7.2	Out-of-band/out-of-block emissions conducted measurements	Part 90 Section 219 (e)(3)	Intermodulation Limit	Mod #1	Pass
4.7.3	EUT spurious emissions conducted measurements	Part 90 Section 219 (e)(3)	Spurious emission	NA	Pass
4.8	Frequency stability measurements	Part 90 Section 219 (e)(4)(i)	Power Limit	NA	NA1
4.9	Radiated Spurious Emission	Part 90 Section 219 (e)(3)	Spurious Emission	NA	Pass

NA = Not Applicable

NA1 = Not applicable. This device does not alter the input signal in ways that can influence the output signal.

ISO/IEC 17025 Decision Rule

The declaration of pass or fail herein is based upon assessment to the specification(s) listed above, including where applicable, assessment of measurement uncertainties. For performance related tests, equipment was monitored for specified criteria identified in that section of testing.

Modifications During Testing

This list is a summary of the modifications made to the equipment during testing.

Summary of Conditions
Modification #1: Change the new firmware to reduce output power. Firmware: 1/DIF board FPGA: FPGA A V1.1_0713 MCU: MCUch32lte_A V1.1_0713 2/RF board MCU: SC_Guardian_DIF_V1_1

Modifications listed above must be incorporated into all production units.

Conditions During Testing

This list is a summary of the conditions noted to the equipment during testing.

Summary of Conditions
None

EQUIPMENT UNDER TEST (EUT)

During testing, numerous configurations may have been utilized. The configurations listed below support compliance to the standard(s) listed in the Summary of Results section.

Configuration 1

Equipment Tested:

Device	Manufacturer	Model #	S/N
Guardian4-A	Cellphone-Mate, Inc.	Guardian4-A	1

Support Equipment:

Device	Manufacturer	Model #	S/N
None			

Configuration 2

General Product Information:

Product Information	Manufacturer-Provided Details
Equipment Type:	Stand-Alone Equipment
Type of Equipment	Zone Enhancer
Operating Frequency Range:	UL: 799-805, 806-816 MHz DL: 769-775, 851-861 MHz
Modulation Type(s):	APCO w/ C4FM Analog FM (25kHz)
Number of TX Chains:	1
Antenna Type(s) and Gain:	Dedicated, See antenna kitting information
Beamforming Type:	NA
Antenna Connection Type:	UL: 50 Ohm/ N Type DL: 50 Ohm/ N Type
Nominal Input Voltage:	120VAC, 60Hz
Firmware used for Test:	1. DIF board FPGA: FPGA A V1.0_0528 MCU: MCUch32lte_A V1.0_0528 2. RF board MCU: SC_Guardian_DIF_V1_0

Block Diagram(s) of Test Setup

Radiated Method Setup

Conducted Method Setup

FCC PART(S) 90

General Test Setup

Summary of Conditions

The equipment under test (EUT) is Public Safety Amplifier. It is a channelized authorized unit. It has 29 channels for 700MHz Band and 32 channels for 800MHz Band

Conducted Emission Method:

The EUT is placed on the test bench.

Evaluation performed at the Outside (Donor) and Inside (Server) antenna port.

The EUT Server port is a type N connector and 50-ohm impedance.

The EUT Donor port is type N connector and 50-ohm impedance.

All switches are in the on position.

Radiated Emission Method:

The EUT is operated and set up as intended. The output of an antenna port is terminated by 50Ohm loads.

The input of antenna port is connected to the signal generation.

The EUT is connected to the Ethernet Switch which is outside of the chamber through RJ45 cable to maximize function of the EUT.

UL: 799-805, 806-816 MHz

DL: 769-775, 851-861 MHz

Test Procedure: 935210 D05 Indus Booster Basic Meas v01r04 Dated April 3, 2020.

3.4 Input-versus-Output Signal comparison

Test Setup/Conditions			
Test Location:	Fremont	Test Engineer:	Hieu Song Nguyenpham
Test Date(s):	7/28/2020		
Configuration:	1		
Test Setup:	See General Test Setup According to section 3.4 KDB 935210 D05V01r04, a 26 dB bandwidth measurement shall be performed on the input signal and the output signal		

Environmental Conditions

Summary of Results

Pass: Summarized in tables and plots below, the spectral shape of the output is similar to input for all modulations. Worst case results are reported for occupied bandwidth comparison test done with and without AGC circuitry activated.

Public Safety 700MHz/800MHz bands

Band	Modulation	Carrier Frequency (MHz)	OBW PreAGC (Hz)	OBW AGC+3 (Hz)	OBW Input (Hz)	Max In&Out Difference (PreAGC)	Max In&Out Difference (AGC+3)

4.7.2 Out-of-Band/Out-of-Block Emissions Conducted Measurements

Test Setup/Conditions			
Test Location:	Fremont	Test Engineer:	Hieu Song Nguyenpham
Test Date(s):	9/15 and 16/2020		
Configuration:	1		
Test Setup:	See General Test Setup This a channelize booster, there are 11 channels for 700MHz Band and 32 channels for 800MHz. Using two signal generators to perform this section at the fo and the frequency next to it. The spacing of the signal are set to the channel spacing of the booster. Modification #1 was in place during testing.		

Test Date	Temperature (°C)	Relative Humidity (%):	Pressure (kPa)
9/15/2020	21.6	48	101.2
9/16/2020	22.8	46	101.3

4.7.3 Spurious Emissions Conducted Measurements

Test Setup/Conditions			
Test Location:	Fremont	Test Engineer:	Hieu Song Nguyenpham
Test Date(s):	7/21/2020		
Configuration:	1		
Test Setup:	See General Test Setup Frequency range of measurement = 9kHz- 9GHz. 9 kHz - 150 kHz -> RBW= 200Hz VBW= 800Hz 150 kHz - 30 MHz -> RBW= 9kHz VBW= 30kHz 30 MHz - 1000MHz -> RBW*= 1MHz VBW= 3MHz 1000 MHz - 9000MHz ->RBW= 1MHz VBW= 3MHz Note: *= measurement performed with larger RBW as worst case. If non-compliant emissions are detected, a final measurement shall be made with a 100 kHz. §90.219 (e) (3) Spurious emissions from a signal booster must not exceed -13 dBm within any 100 kHz measurement bandwidth. §90.543 Emission limitations. (c) Out-of-band emission limit. On any frequency outside of the frequency ranges covered by the ACP tables in this section, the power of any emission must be reduced below the mean output power (P) by at least $43 + 10\log(P)$ dB measured in a 100 kHz bandwidth for frequencies less than 1 GHz, and in a 1 MHz bandwidth for frequencies greater than 1 GHz. (f) For operations in the 758-775 MHz and 788-805 MHz bands, all emissions including harmonics in the band 1559-1610 MHz shall be limited to -70 dBW/MHz equivalent isotropically radiated power (EIRP) for wideband signals, and -80 dBW EIRP for discrete emissions of less than 700 Hz bandwidth. For the purpose of equipment authorization, a transmitter shall be tested with an antenna that is representative of the type that will be used with the equipment in normal operation

Summary of Results

Pass: Summarized in plots below, the conducted spurious emissions are within limits.

9kHz-30 MHz

No Conducted Spurious Emissions were found within 20dB of the limit.

Limit Line For Spurious Conducted Emission

$$\text{REQUIRED ATTENUATION} = 43 + 10 \log P \text{ DB}$$

$$\text{Limit line (dBuV)} = V_{\text{dBuV}} - \text{Attenuation}$$

$$\begin{aligned} V_{\text{dBuV}} &= 20 \log \frac{V}{1 \times 10^{-6}} \\ &= 20 (\log V - \log 1 \times 10^{-6}) \\ &= 20 \log V - 20 \log 1 \times 10^{-6} \\ &= 20 \log V - 20 (-6) \\ &= 20 \log V + 120 \end{aligned}$$

$$\begin{aligned} \text{Attenuation} &= 43 + 10 \log P \\ &= 43 + 10 \log \frac{V^2}{R} \\ &= 43 + 10 (\log V^2 - \log R) \\ &= 43 + 10 (2 \log V - \log R) \\ &= 43 + 20 \log V - 10 \log R \end{aligned}$$

$$\begin{aligned} \text{Limit line} &= V_{\text{dBuV}} - \text{Attenuation} \\ &= 20 \log V + 120 - (43 + 20 \log V - 10 \log R) \\ &= 20 \log V + 120 - 43 - 20 \log V + 10 \log R \\ &= 20 \log V + 120 - 43 - 20 \log V + 10 \log R \\ &= 120 - 43 + 10 \log 50 \quad \text{Note : } R = 50 \Omega \\ &= 120 - 43 + 16.897 \\ &= 94 \text{ dBuV at any power level} \end{aligned}$$

4.9 Radiated Spurious Emission

Test Setup/Conditions			
Test Location:	Fremont	Test Engineer:	Hieu Song Nguyenpham
Test Date(s):	7/20/2020		
Configuration:	2		
Test Setup:	The equipment under test (EUT) is placed on the Styrofoam table top. EUT set at maximum gain. A remotely located signal generator is connected to input of EUT. Evaluation of DL path was performed with signal fed into the Outside antenna port while Inside antenna port terminated with 50 Ohm load. Evaluation of UL path was performed with signal fed into the Inside antenna port while Outside antenna port terminated with 50 Ohm load. UL: 799-805, 806-816 MHz DL: 769-775, 851-861 MHz Test procedure: The test was performed IAW 47CFR, Section 2.1053 and Appendix D3 of the FCC document: 935210 D05 Indus Booster Basic Meas v01r04 Dated April 03, 2020 Frequency range of measurement = 9kHz- 10GHz. 9 kHz - 150 kHz -> RBW= 200Hz VBW= 800Hz 150 kHz - 30 MHz -> RBW= 9kHz VBW= 30kHz 30 MHz - 1000MHz -> RBW= 100kHz VBW= 3MHz 1000 MHz - 10000MHz ->RBW= 1MHz VBW= 3MHz Emissions in the band 1559-1610 MHz were investigated and these were not found within 20dB of the limit line		

Limit Line For Spurious Radiated Emission

$$\text{REQUIRED ATTENUATION} = 43+10 \text{ LOG } P \text{ (DB)}$$

For radiated spurious emission measured at 3 meter test distance,

$$\text{Required attenuation} = 43+10 \text{ Log } P_{t \text{ at 3 meter}} \text{ dB}$$

$$\text{Limit line (dBuV)} = E_{\text{dBuV}} - \text{Attenuation}$$

E_{dBuV} = Measured field strength at 3 meter in dBuV/m

Power Density (Isotropic)

$$P_D = \frac{P_t}{4\pi r^2}$$

P_D = Power Density in Watts /m²
 P_t = Average Transmit Power
 r = Test distance

Field Intensity E (V/m)

$$E = \sqrt{P_D \times 377}$$

$$E = \frac{\sqrt{P_t \times 377}}{4\pi r^2}$$

$$E = \sqrt{\frac{P_t \times 30}{r^2}}$$

$$P_t = \left(\frac{E^2 \times r^2}{30} \right)$$

$$10 \log P_t = 10 \log E^2 (V/m) + 10 \log r^2 - 10 \log 30$$

$$10 \log P_t = 20 \log E (V/m) + 20 \log r - 10 \log 30$$

At 3 meter, $r = 3$ m

$$10 \log P_t = 20 \log E (V/m) + 20 \log 3 - 10 \log 30$$

$$10 \log P_t = 20 \log E (V/m) + 9.54 - 14.77$$

$$10 \log P_t = 20 \log E (V/m) - 5.23$$

Since $20 \log E (V/m) = 20 \log E (\mu V/m) - 120$

$$10 \log P_t = 20 \log E (\mu V/m) - 120 - 5.23$$

$$10 \log P_t = 20 \log E (\mu V/m) - 125.23$$

$$\text{Limit line (dBuV) at 3 meter} = E_{dBuV} - \text{Attenuation}$$

$$= E_{dBuV} - (43 + 10 \log P_t \text{ at 3 meter})$$

$$= E_{dBuV} - 43 - 10 \log P_t \text{ at 3 meter}$$

$$= E_{dBuV} - 43 - (20 \log E (\mu V/m) - 125.23)$$

$$= E_{dBuV} - 43 - 20 \log E (\mu V/m) + 125.23$$

$$= E_{dBuV} - 20 \log E (\mu V/m) + 82.23$$

$$\text{Since } 20 \log E (\mu V/m) = E \text{ in dBuV/m} = E_{dBuV} - E_{dBuV} + 82.23$$

$$\text{Radiated Emission limit 3 meter} = 82.23 \text{ dBuV at any power level measured in dBuV}$$

SUPPLEMENTAL INFORMATION

Measurement Uncertainty

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

Uncertainties reported are worst case for all CKC Laboratories' sites and represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of $k=2$. Compliance is deemed to occur provided measurements are below the specified limits.

Emissions Test Details

TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in $\text{dB}\mu\text{V}/\text{m}$, the spectrum analyzer reading in $\text{dB}\mu\text{V}$ was corrected by using the following formula. This reading was then compared to the applicable specification limit. Individual measurements were compared with the displayed limit value in the margin column. The margin was calculated based on subtracting the limit value from the corrected measurement value; a positive margin represents a measurement exceeding the limit, while a negative margin represents a measurement less than the limit.

SAMPLE CALCULATIONS		
	Meter reading	($\text{dB}\mu\text{V}$)
+	Antenna Factor	(dB/m)
+	Cable Loss	(dB)
-	Distance Correction	(dB)
-	Preamplifier Gain	(dB)
=	Corrected Reading	($\text{dB}\mu\text{V}/\text{m}$)

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz
RADIATED EMISSIONS	1000 MHz	>1 GHz	1 MHz

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or caret ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point, the measuring device is set into the linear mode and the scan time is reduced.
