

Hello Mark and Jason:

Thank you for your e-mail. This will confirm that the enclosure material and overall general "battery shape" of the device enclosure remains unchanged. Both the new device under FCC ID #RSO-8939 and the same device under previous FCC ID #Q9N-AAT were both made of the same identical ABS plastic material, no metal was used in either the current device housing nor the previous device housing except for the + and - battery terminals, obviously. There was no shielding associated with the housing and thus no change whatsoever in radiated emissions between the cosmetic plastic housings. Therefore we too don't feel an engineering evaluation (retesting) is needed; plus we know ourselves the device performance and operating range is still identical.

Please advise if you the above in the form of a letter on letterhead otherwise please forward this part of the e-mail to the TCB as soon as possible.
