## FCC §18.307 - AC LINE CONDUCTED EMISSIONS

### Applicable Standard

Conduction limits. For the following equipment, when designed to be connected to the public utility (AC) power line the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies shall not exceed the limits in the following tables. Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal using a 50  $\mu$ H/50 ohms line impedance stabilization network (LISN).

RF lighting devices

Frequency (MHz)	Maximum RF line voltage measured with a 50 $\mu$ H/50 ohm LISN ( $\mu$ V)
Non-consumer equipment	
0.45 to 1.6	1000
1.6 to 30	3000
Consumer equipment	
0.45 to 2.51	250
2.51 to 3.0	3000
3.0 to 30	250

### EUT Setup

- Note: 1. Support units were connected to second LISN.  
 2. Both of LISNs (AMN) 80 cm from EUT and at the least 80 cm from other units and other metal planes support units.

The setup of EUT is according with MP-5: 1986 measurement procedure. Specification used was with the FCC Part 18 limits.

The external I/O cables were draped along the test table and formed a bundle 30 to 40 cm long in the middle.

The lamp socket was connected to a 120 VAC/60 Hz power source.

### EMI Test Receiver Setup

The EMI test receiver was set to investigate the spectrum from 450 kHz to 30 MHz.

During the conducted emission test, the EMI test receiver was set with the following configurations:

Frequency Range	IF B/W
450 kHz – 30 MHz	9 kHz

### Test Procedure

During the conducted emission test, the lamp socket was connected to the outlet of the LISN.

Maximizing procedure was performed on the six (6) highest emissions of the EUT.

All data was recorded in the Quasi-Peak detection and Average detection mode.

The corrected factor has been input into the transducer of the test software.
- 3) Margin = Limit – Corrected Amplitude

## FCC §18.305 – FIELD STRENGTH

### Applicable Standard

FCC §18.305(b)

### EUT Setup

The radiated emission tests were performed in the 3 meters chamber test site, using the setup accordance with the FCC MP - 5.

The lamp socket was connected to a 120 VAC/60 Hz power source.

### EMI Test Receiver Setup and Spectrum Analyzer Setup

The system was investigated from 9 kHz to 30 MHz.

During the radiated emission test, the EMI test receiver and Spectrum Analyzer were set with the following configurations:

Frequency Range	RBW	Video B/W	IF B/W	Detector
9 kHz – 150 kHz	100 Hz	300 Hz	200 Hz	QP
150 kHz – 30 MHz	10 kHz	30 kHz	9 kHz	QP

## Test Procedure

During the radiated emission test, the lamp socket was connected to the AC floor outlet.

Maximizing procedure was performed on the six (6) highest emissions of the EUT.

All data was recorded in the Quasi-Peak detection mode.

## Corrected Amplitude Calculation

The Corrected Amplitude is calculated by adding the Antenna Factor and Cable Loss from the Meter Reading. The basic equation is as follows:

$$\text{Corrected Amplitude} = \text{Reading} + \text{Antenna Factor} + \text{Cable Loss}$$

The “**Margin**” column of the following data tables indicates the degree of compliance with the applicable limit. For example, a margin of 7 dB means the emission is 7 dB below the limit. The equation for margin calculation is as follows:

$$\text{Margin} = \text{Limit} - \text{Corrected Amplitude}$$
