RE: Summary of differences from already approved version  
FCC ID: S3O-CEL-BP

To Whom It May Concern:

1. Kirk module card (PDE2509BP) has been merged into the main card. Original idea of maintaining the foot-print for a separate kirk module card (PDE2509BP) as well was not possible.
2. Power card connection has been polarized. Connecting the power card wrongly to the main card causes a significant fail rate.
3. XLR cable assembly has been eliminated (90% of the re-assembly is caused by the XLR cable assembly related faults)
4. Aux card has been merged into the main card (total number of cards are reduced from 5 to 3)
5. Top card connection has been changed from SMD connection to FFC cable connection, increasing the reliability.
6. Main card has been designed for ICT testing. This will increase the first time pass rate both at the source (contract manufacturer) and at the assembly site.

Thank you for your attention to this matter.

Yours faithfully
