3 Test Summary

Test	Test Requirement	Test Method	Class / Severity	Result
Radiated Emission (30MHz to 25GHz)	FCC PART 15: 2003	ANSI C63.4: 1992	Class B	PASS
Conducted Emission (150KHz to 30MHz)	FCC PART 15: 2003	ANSI C63.4: 1992	Class B	PASS

4 General Information

4.1 Client Information

Applicant: **Shenzhen Micah Electronics Corp**
Address of Applicant: 1/F., Bldg.M6, Middle District, High and New Technique
Industrial Garden, Shenzhen, China

4.2 General Description of E.U.T.

Product description: USB Dongle
Model No.: BC03ATHE-01

4.3 Details of E.U.T.

Power Supply: USB Signal input

4.4 Description of Support Units

The EUT has been tested as an independent unit.

4.5 Standards Applicable for Testing

The customer requested FCC tests for a USB Dongle. The standards used were FCC 15 Paragraph 15.205, Paragraph 15.207, Paragraph 15.209, Paragraph 15.31, Paragraph 15.33, Paragraph 15.35, Paragraph 15.247.

4.6 Test Facility

The test facility is recognized, certified, or accredited by the following organizations:

- **FCC – Registration No.: 662850**

Shenzhen Huatongwei International Inspection Co., Ltd, EMC Laboratory has been registered and fully described in a report filed with the (FCC) Federal Communications Commission. The acceptance letter from the FCC is maintained in our files. Registration 662850, November 17, 2003.

4.7 Test Location

All Emissions tests were performed at:-Shenzhen Huatongwei International Inspection Co., Ltd. at Keji S,12th,Road, Hi-tech Industrial Park, Shenzhen, Guangdong, China.

5 Equipment Used during Test

Conducted Emission Test

6 Conducted Emission Test

Test Requirement:	FCC Part15 Paragraph 15.207
Test Method:	Based on FCC Part15 Paragraph 15.207
Test Date:	April 21, 2005
Frequency Range:	150kHz to 30MHz
Class:	Class B
Detector:	Peak for pre-scan (9kHz Resolution Bandwidth) Quasi-Peak & Average if maximised peak within 6dB of Average Limit

6.1 Test Equipment

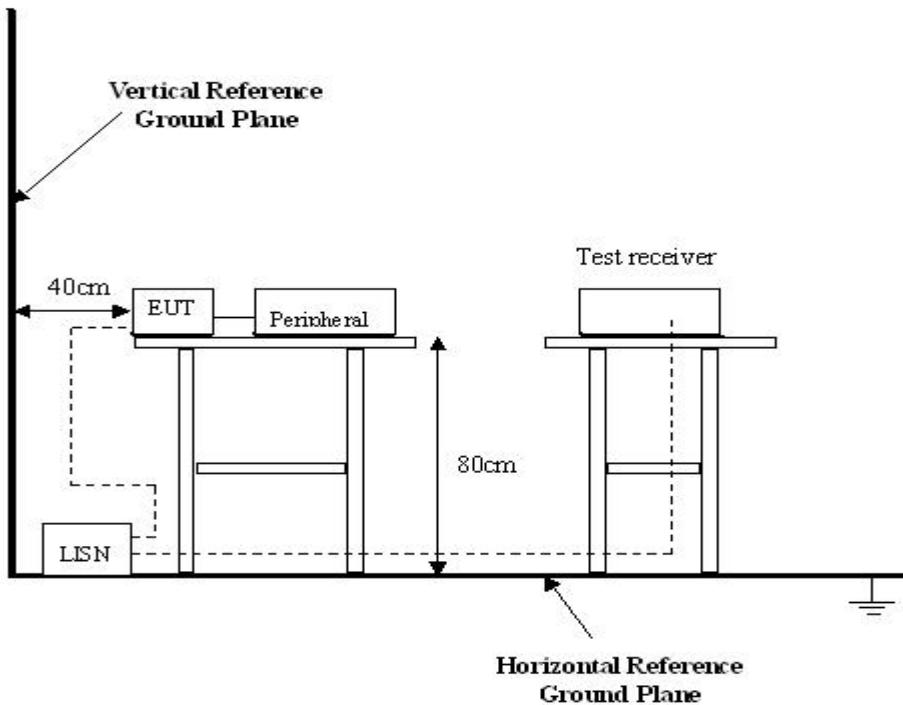

Please refer to Section 5 this report.

6.2 Test Procedure

1. The EUT was tested according to ANSI C63.4. The frequency spectrum from 150kHz to 30MHz was investigated.
2. The maximised peak emissions from the EUT was scanned and measured for both the Live and Neutral Lines. Quasi-peak & average measurements were performed if peak emissions were within 6dB of the average limit line.

6.3 Conducted Test Setup

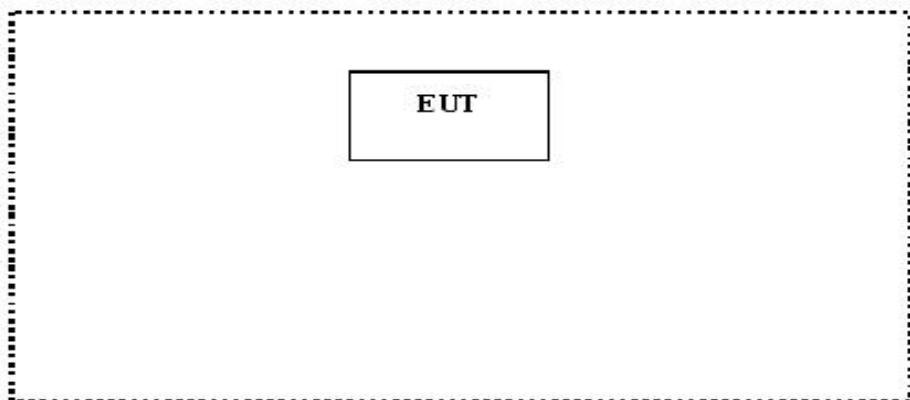

The conducted emission tests were performed using the setup accordance with the ANSI C63.4, The specification used in this report was the FCC Part15 Paragraph 15.207 limits.

6.4 EUT Operating Condition

Operating condition is according to ANSI C63.4.

- A. Setup the EUT and simulators as shown on follow.
- B. Enable RF signal and confirm EUT active.
- C. Modulate output capacity of EUT up to specification.

6.5 Conducted Emission Limits

66-56 dB μ V/m between 0.15MHz & 0.5MHz

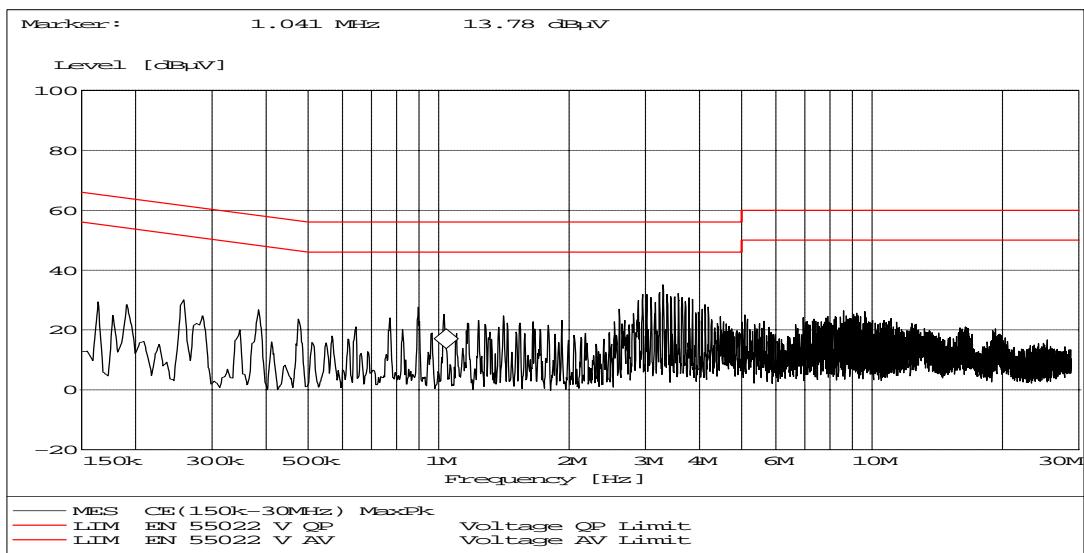

56 dB μ V/m between 0.5MHz & 5MHz

60 dB μ V/m between 5MHz & 30MHz

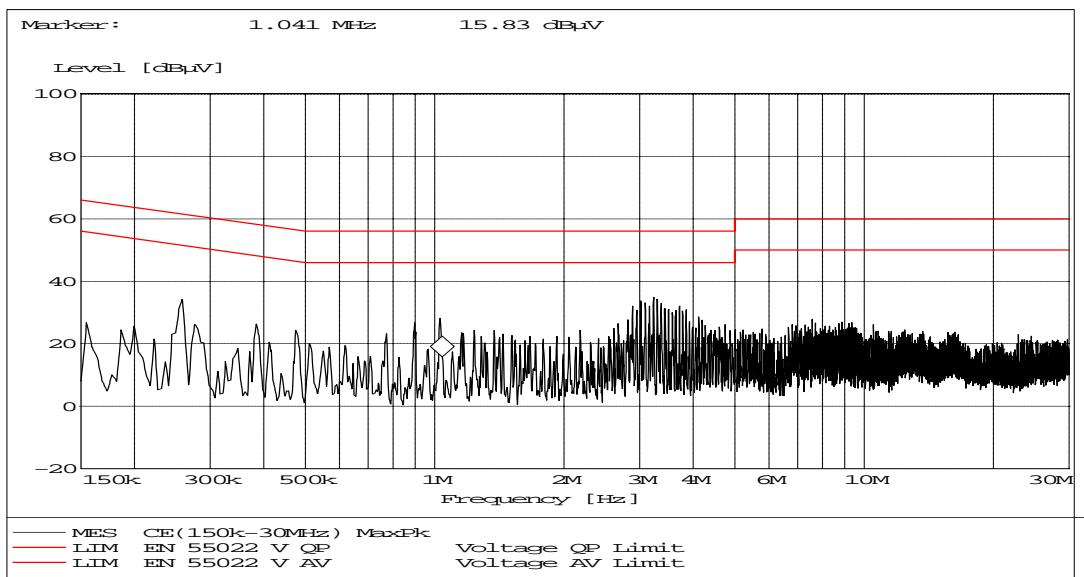

Note: In the above limits, the tighter limit applies at the band edges.

6.6 Conducted Emission Test Result

Live Line:

Neutral Line:

6.7 Conductied Emissions Test Data

Freq. MHz	Line	QP Reading dBuV	Limit dBuV	Margin dB	AV Reading dBuV	Limit dBuV	Margin dB

6.013	Neutral	24.3	60.0	35.7	19.7	50.0	30.3

7 Radiation Emission Test

Test Requirement:	FCC Part15 Paragraph 15.209 and Paragraph 15.247
Test Method:	Based on ANSI 63.4
Test Date:	April 21, 2005
Frequency Range:	30MHz to 25GHz
Measurement Distance:	3m
Detector:	Peak for pre-scan (120kHz resolution bandwidth) Quasi-Peak if maximised peak within 6dB of limit

7.1 Test Equipment

Please refer to Section 5 this report.

7.2 Measurement Uncertainty

All measurements involve certain levels of uncertainties, especially in the field of EMC. The factors contributing to uncertainties are spectrum analyzer, cable loss, antenna factor calibration, antenna directivity, antenna factor variation with height, antenna phase center variation, antenna factor frequency interpolation, measurement distance variation, site imperfections, mismatch (average), and system repeatability.

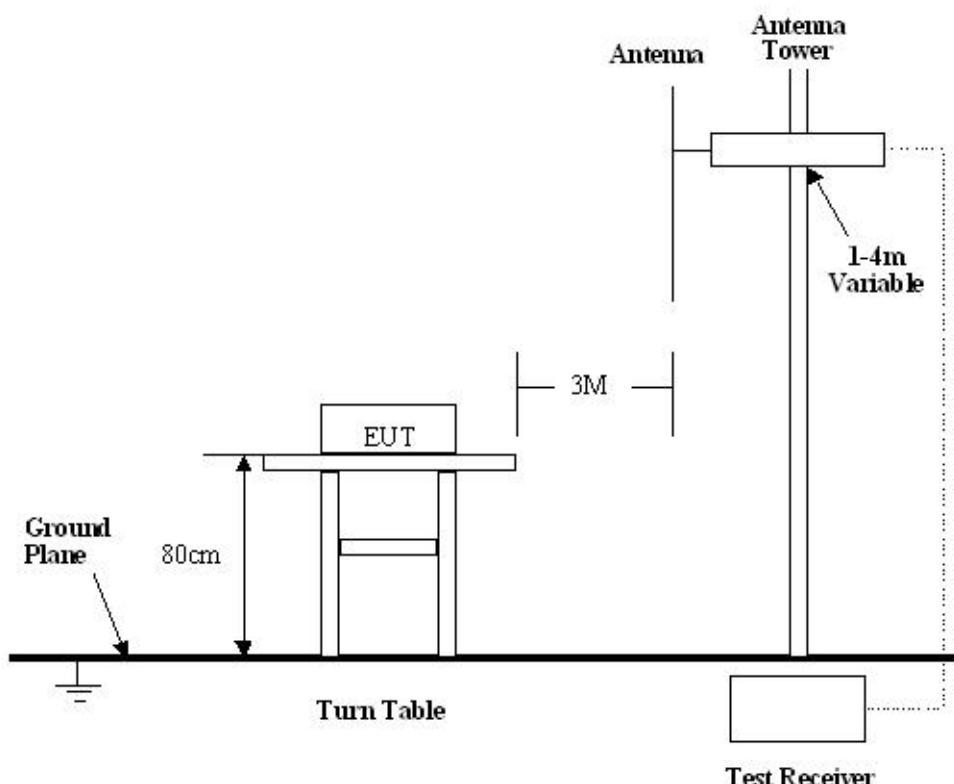

Based on ANSI C63.4, The Treatment of Uncertainty in EMC Measurements, the best estimate of the uncertainty of a radiation emissions measurement at SZHTW is +4.0 dB.

7.3 Test Procedure

1. For the radiated emissions test, since the EUT does not have a power source, there was no connection to AC outlets.
2. Maximizing procedure was performed on the six (6) highest emissions to ensure EUT is compliant with all installation combinations.
3. All data was recorded in the peak detection mode. Quasi-peak readings was performed only when an emission was found to be marginal (within -4 dB μ V of specification limits), and are distinguished with a "Qp" in the data table.
4. The EUT was under normal mode during the final qualification test and the configuration was used to represent the worst case results.

7.4 Radiated Test Setup

The radiated emission tests were performed in the 3m Semi- Anechoic Chamber test site, using the setup accordance with the ANSI C63.4, The specification used in this report was the FCC Part15 Paragraph 15.209 and Paragraph 15.247 limits.

7.5 Spectrum Analyzer Setup

According to FCC Part15 Paragraph 15.209 and Paragraph 15.247 Rules, the system was tested to 25000 MHz.

Start Frequency	30 MHz
Stop Frequency	25000 MHz
Sweep Speed	Auto
IF Bandwidth	100 kHz
Video Bandwidth	1 MHz
Quasi-Peak Adapter Bandwidth	120 kHz
Quasi-Peak Adapter Mode	Normal
Resolution Bandwidth	1MHz

7.6 Corrected Amplitude & Margin Calculation

The Corrected Amplitude is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain from the Amplitude reading. The basic equation is as follows:

$$\text{Corr. Ampl.} = \text{Indicated Reading} + \text{Antenna Factor} + \text{Cable Factor} - \text{Amplifier Gain}$$

The “**Margin**” column of the following data tables indicates the degree of compliance with the applicable limit. For example, a margin of $-7\text{dB}\mu\text{V}$ means the emission is $7\text{dB}\mu\text{V}$ below the maximum limit for Class B. The equation for margin calculation is as follows:

$$\text{Margin} = \text{Corr. Ampl.} - \text{Class B Limit}$$

7.7 Summary of Test Results

According to the data in section 7.10, the EUT complied with the FCC Part15 Paragraph 15.209 and Paragraph 15.247 standards.

7.8 EUT Operating Condition

Same as section 6.4 of this report.

Let the EUT work in test mode(Tx Low/Tx Middle/Tx High) and test it.

7.9 Radiated Emissions Limit

A. FCC Part 15 subpart C Paragraph 15.247 Limit

Fundamental Frequency	Field Strength of Fundamental		Field Strength of Harmonics	
	mV/m	dBuV/m	uV/m	dBuV/m
902-928MHz	50	94	500	54
2400-2483.5 MHz	50	94	500	54
5725-5875 MHz	50	94	500	54
24.0-24.25GHz	250	108	2500	68

Note: (1) RF Voltage(dBuV)=20 log RF Voltage(uV)

(2) Distance refers to the distance in meters between the measuring instrument antenna and the closed point of any part of the device or system.

(3) The emission limit in this paragraph is based on measurement instrumentation employing an average detector. Measurement using instrumentation with a peak detector function, corresponding to 20dB above the maximum permitted average limit.

(4) Above 1GHz, do a Peak and average measurements for all emissions, Limit for peak is 74dBuV/m, According to Part 15.35(b) and average is 54BuvV/m.

B. Frequencies in restricted band are complied to limit on Paragraph 15.209

Frequency(MHZ)	Distance(m)	Field strength(dBuV/m)
30-88	3	40.0
88-216	3	43.5
216-960	3	46.0
Above 960	3	54.0

Note: (1) RF Voltage(dBuV)=20 log RF Voltage(uV)

(2) In the Above Table, the tighter limit applies at the band edges.

(3) Distance refers to the distance in meters between the measuring instrument antenna.

7.10 Radiated Emissions Test Result

Formula of conversion factors: the field strength at 3m was established by adding The meter reading of the spectrum analyser (which is set to read in units of dBuV) To the antenna correction factor supplied by the antenna manufacturer. The antenna Correction factors are stated in terms of dB. The gain of the preselector was accounted For in the spectrum analyser meter reading.

Example:

Freq(MHz) Meter Reading +ACF=FS

33 20dBuV+10.36dB=30.36dBuV/m @3m

A. Fundamental Radiated Emission Data

Test Item:	Fundamental Radiated Emission Data
Test Voltage:	Power From USB Signal input
Test Mode:	On(Tx Low/Tx Middle/Tx High)
Temperature:	24 °C
Humidity:	52%RH
Test Result:	PASS

Frequency (MHz)	Antenna Polarization	Emission Level (dBuV/m)	FCC 15 Subpart C Limit (dBuV/m)	Margin (dB)	Antenna Height (m)	Turntable Angle (°)
Low frequency						
2402.393145	Vertical	85.10	94.0	8.90	1.5	90
2402.393145	Horizontal	86.30	94.0	7.70	1.5	90
Middle frequency						
2441.895433	Vertical	87.66	94.0	6.34	1.5	90
2441.895433	Horizontal	86.59	94.0	7.41	1.5	90
High frequency						
2480.682011	Vertical	86.70	94.0	7.30	1.5	90
2480.682011	Horizontal	85.10	94.0	8.90	1.5	90

Note:

- (1) Above 1GHz,do a peak and average measurements for all emissions,Limit for peak is 74dBuV/m,According to part15.35(b) and average is 54dBuV/m.
- (2) The field strength of fundamental radiation emissions limit for average is 94dBuV/m.
- (3) General Radiated Emission No significant emissions above the equipment noise floor were detected.
- (4) Emission Level = Reading Level + Probe Factor + Cable Loss.

B. General Radiated Emission Data

Test Item: General Radiated Emission Data
Test Voltage: Power From USB Signal input
Test Mode: On TX
Temperature: 24 °C
Humidity: 52%RH
Test Result: PASS

8 Maximum Peak Output Power

Test Requirement:	FCC Part15 Paragraph 15.247
Test Method:	Based on ANSI 63.4
Test Date:	April 21, 2005
Test mode:	Compliance test in the worse case: Tx Low/Tx Middle/Tx High
Requirements:	Regulation 15.247(b) The limit of Maximum Peak Output Power Measurement is 1W(30dBm)

Test procedure:

The technique used to find the output power of the transmitter was the antenna substitution method. Substitution method was performed to determine the actual ERP emission levels of the EUT.

The following test procedure as below:

1. The EUT was powered ON and placed on a table in the chamer.The antenna of the transmitter was extended to its maximum length.
2. The fundamental frequency of th transmitter was maximized on the test receiver display by raising and lowering the receive antenna and by rotating the turntable.After the fundamental emission was maximized,afield strength measurement was made.
3. Steps 1 and 2 were performed with the EUT and the receive antenna in both vertical and horizontal polarization.
4. Calculate the transmitter's peak power using the following equation:

$$\text{Power} = (E \times d)^2 / (30 \times G)$$

Where:E= the measured maximum field strength in V/m.

Set the RBW>6dB bandwidth of the emission or use a peak power meter.

.G= the numeric gain of the transmitting antenna over an isotropic radiator.

.d= the distance in meters from which the field strength was measured.

.P= the power in watts is the final Maximum Peak Output Power.

Test Result:

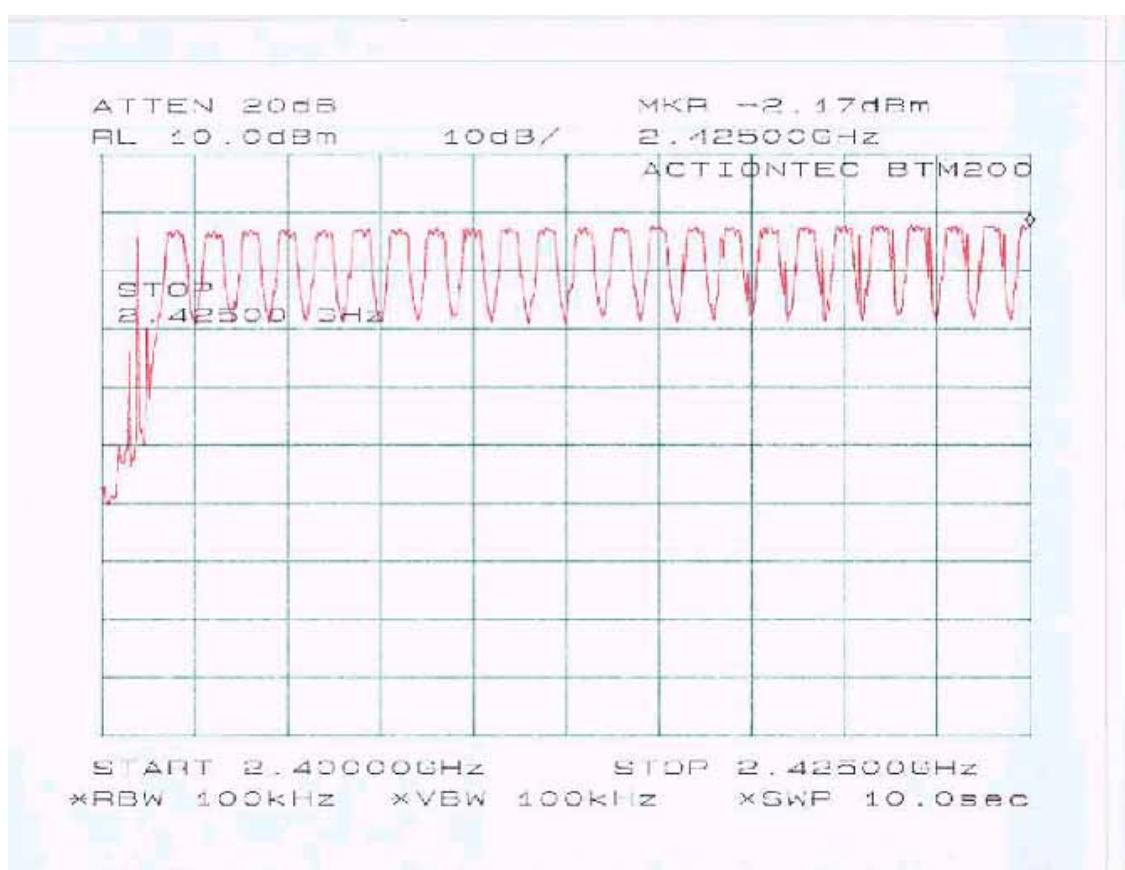

Test Channel	Fundamental Frequency(GHz)	Reading (dBm)	Cable Loss dB	Output Power (dBm)	Limit (dBm)	PASS/FAIL
low	2.402	-9.12	0.2	-8.92	30	PASS
middle	2.441	-9.04	0.2	-8.84	30	PASS
high	2.480	-9.07	0.2	-8.87	30	PASS

Test Results:The unit does meet the FCC requirements.

9 Hopping Channel Number

Test Requirement: FCC Part15 C
Test Method: Based on FCC Part15 Paragraph 15.247
Test Date: April 21, 2005
Test mode: The EUT work in test mode(Tx) and test it
Requirements: Regulation 15.247(a) For frequency hopping systems operating
In the 2400-2483.5MHz band employing at least 50hopping
channels.
Test result: Total channels are 80 channels,channel 0 to 79.
The unit does meet the FCC requirements.

Please fefer the graph as below:

10 Carrier Frequencies Separated

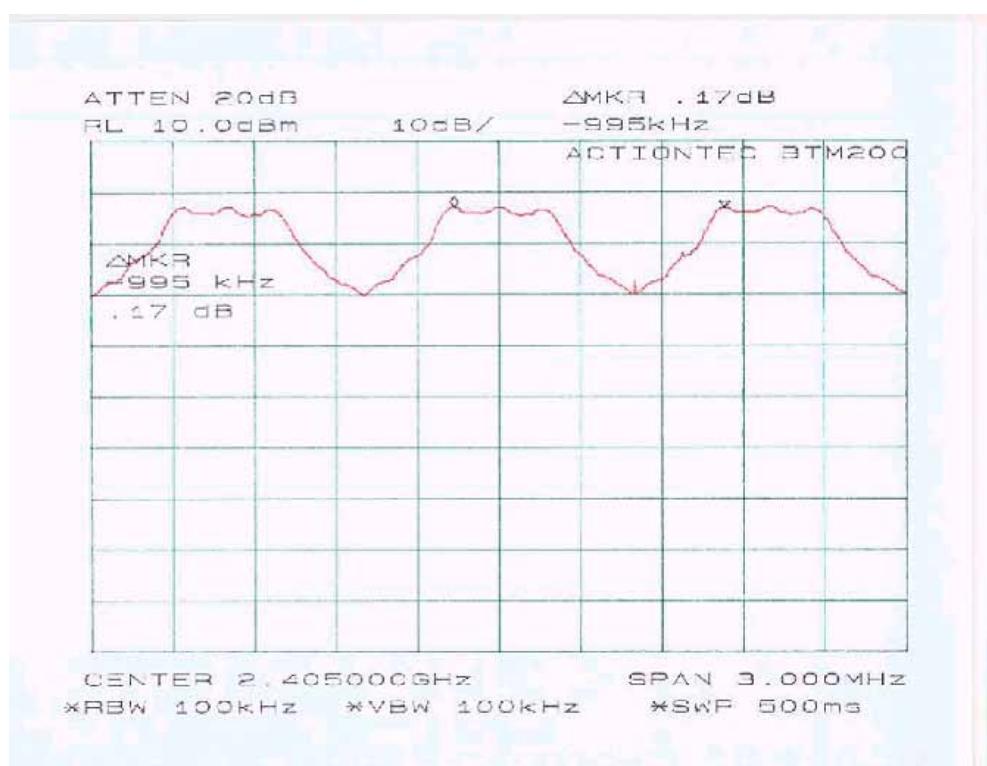

Test Requirement: FCC Part15 C
Test Method: Based on FCC Part15 Paragraph 15.247
Test Date: April 21, 2005
Test mode: The EUT work in test mode(Tx) and test it
Requirements: The bandwidth of the fundamental frequency was measur by spectrum analyser with 100KHz RBW and 100KHz VBW.The 20dB bandwidth is defined as the total spectrum the power of which is higher than peak power minus 20dB.
Test result: PASS

Channel Carrier Frequency Separated

Test Channel	Carrier Frequencies Separated	PASS/FAIL
Lower Channels (channel 0 and channel 1)	0.995MHz	Pass

The unit does meet the FCC requirements.

10.1 Lower Channels:Carrier Frequencies Separated

11 Dwell Time

Test Requirement:	FCC Part15 C
Test Method:	Based on FCC Part15 Paragraph 15.247
Test Date:	April 21, 2005
Test mode:	The EUT work in test mode(Tx) and test it

Requirements: 15.247 a(1)(iii)Frequency hopping systems in the 2400-2483.5MHz band shall use at least 15 non-overlapping channels.The average time of occupancy on any channel shall not greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

11.1 Test procedure

EUT and its simulators are placed on a turn table, the EUT and let it work normally, let EUT working in test mode,then test it.

The bandwidth of the fundamental frequency was measured with the spectrum analyser using 100KHz RBW and 100KHz VBW, set sweep time:5 ms.Span:0Hz.

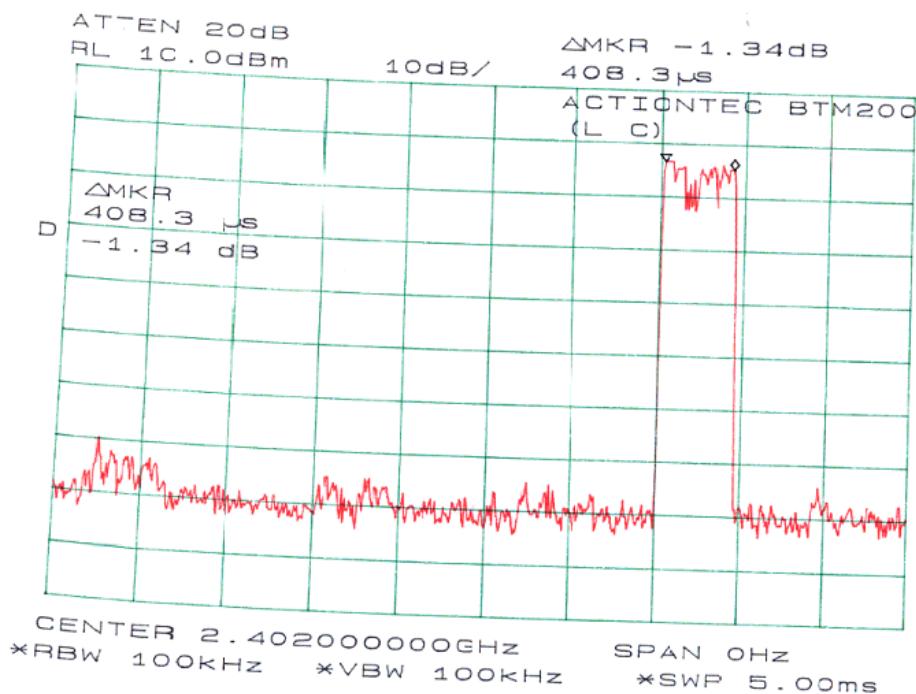

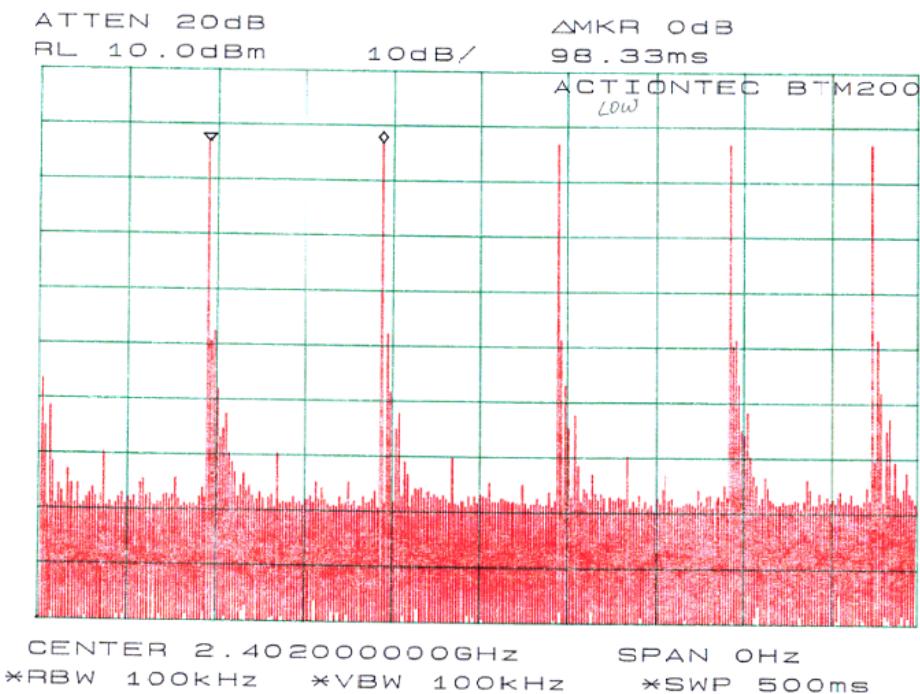

11.2 Test Results : PASS

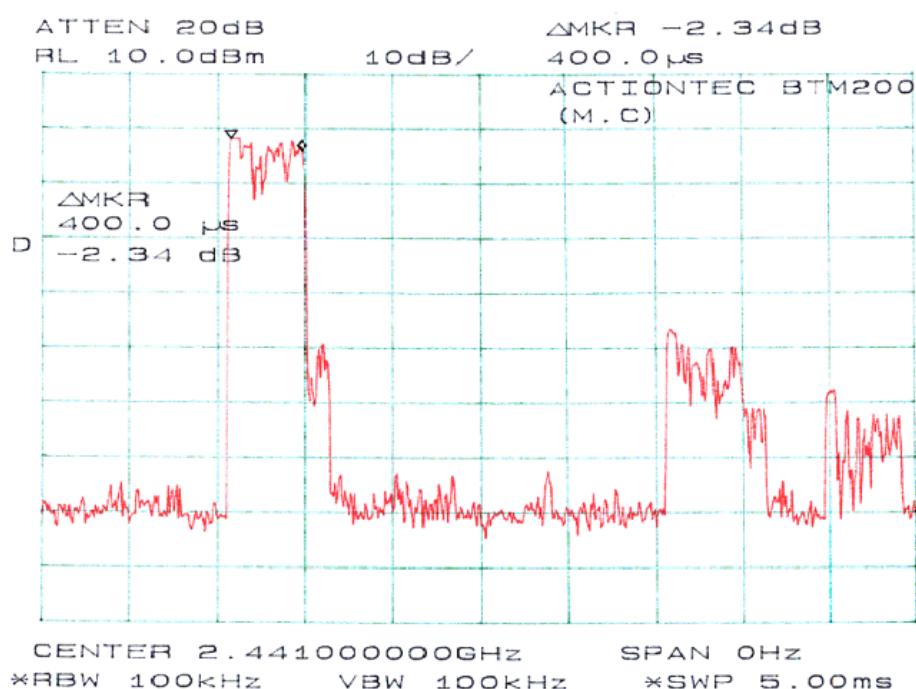

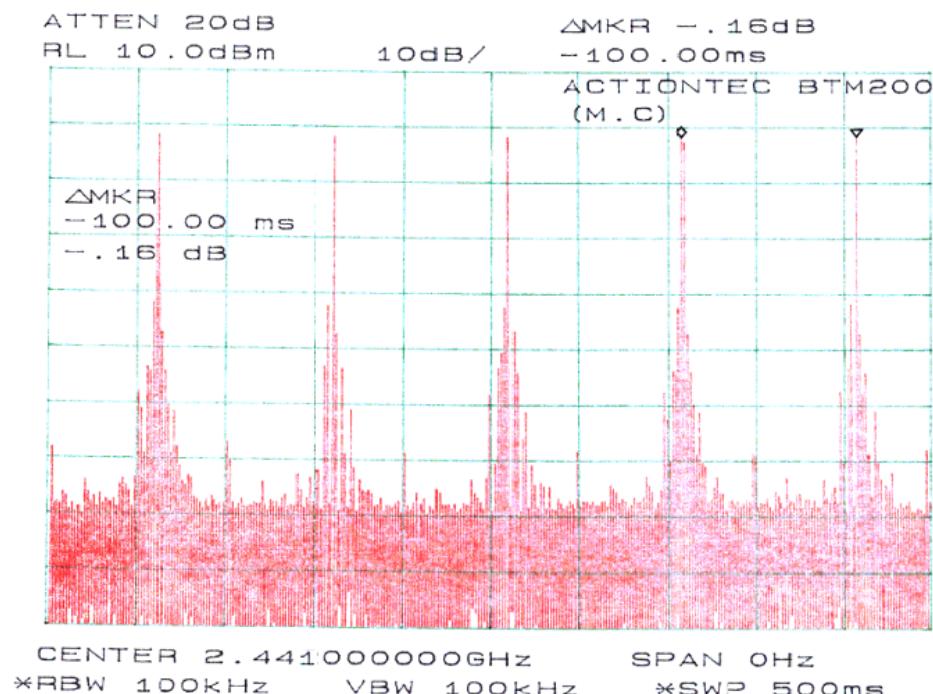

Sample calculation: In normal operation, there are 5 transmissions per 500mS. Therefore, the dwell time for each channel is:

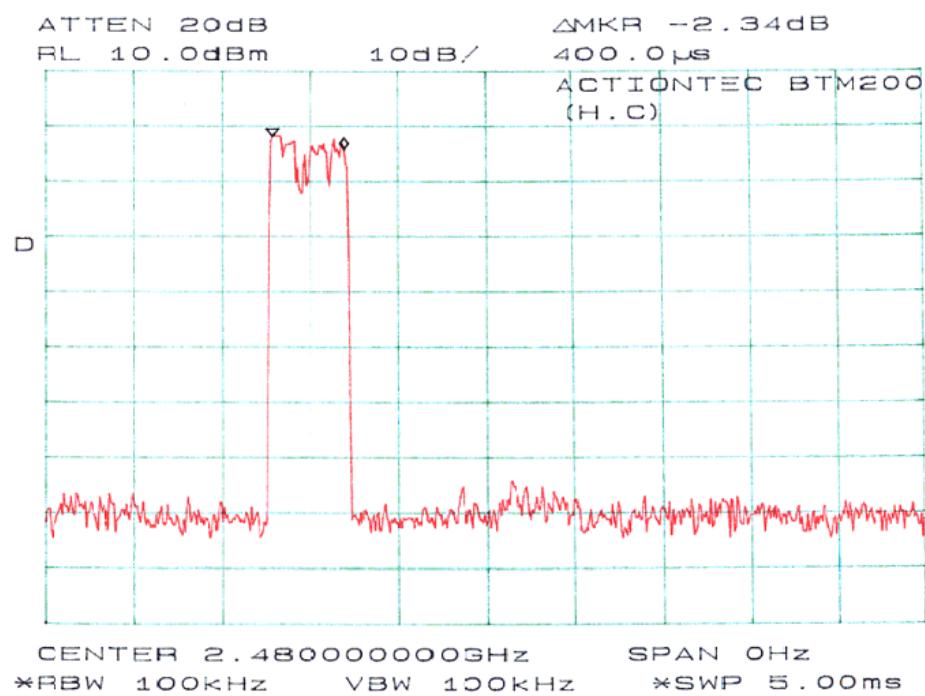

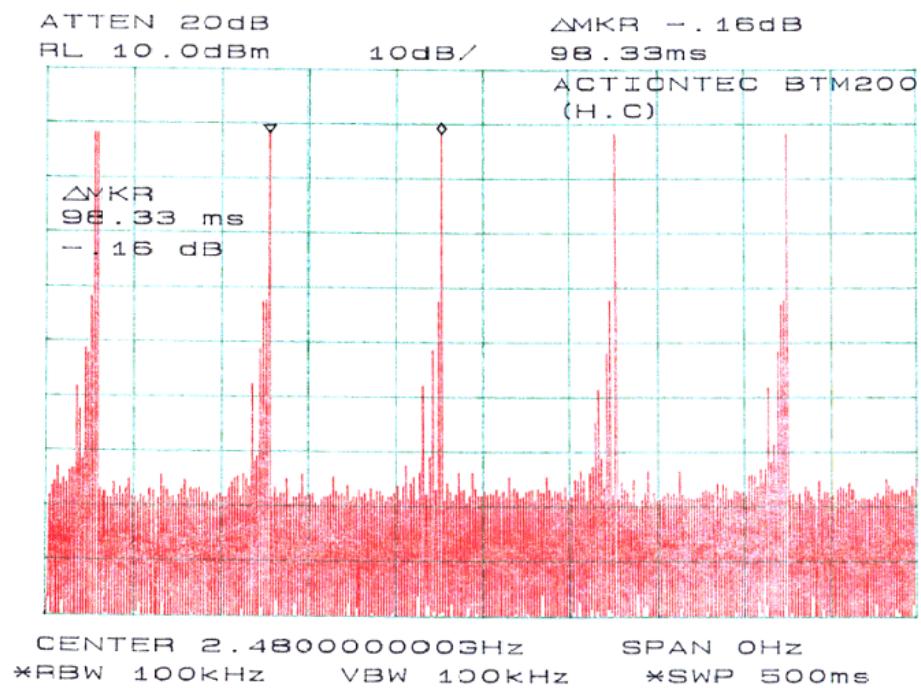

Low Channel: $5 \times 0.408 \times 0.0632 = 0.128928 \text{ s} < 0.4 \text{ s}$

The Results are not be greater than 0.4 seconds.

Please fefer the graph as below:

Channel 0: 2.402GHz

Channel 39: 2.441GHz

Channel 79: 2.480GHz

12 Band Edge

Test Requirement: FCC Part15 C
Test Method: Based on FCC Part15 Paragraph 15.247
Test Date: April 21, 2005
Test mode: On TX

12.1 Test Procedure

1. The EUT, peripherals were put on the turntable which table size is 1mX1.5m, table high 0.8m. All set up is according to ANSI C63.4.
2. With the EUT's antenna attached, The EUT's radiated emission power was received by the test antenna which was connected to the spectrum analyser with the START and STOP frequencies set to the EUT's operation band. Measurements were made at 3 meters.
3. The antenna height were varied from 1m to 4m high to find the maximum emission for each frequency.
4. The bandwidth of the fundamental frequency was measured by spectrum analyser with 100KHz RBW and 100KHz VBW. The 20dB bandwidth is defined as the total spectrum the power of which is higher than peak power 20dB.

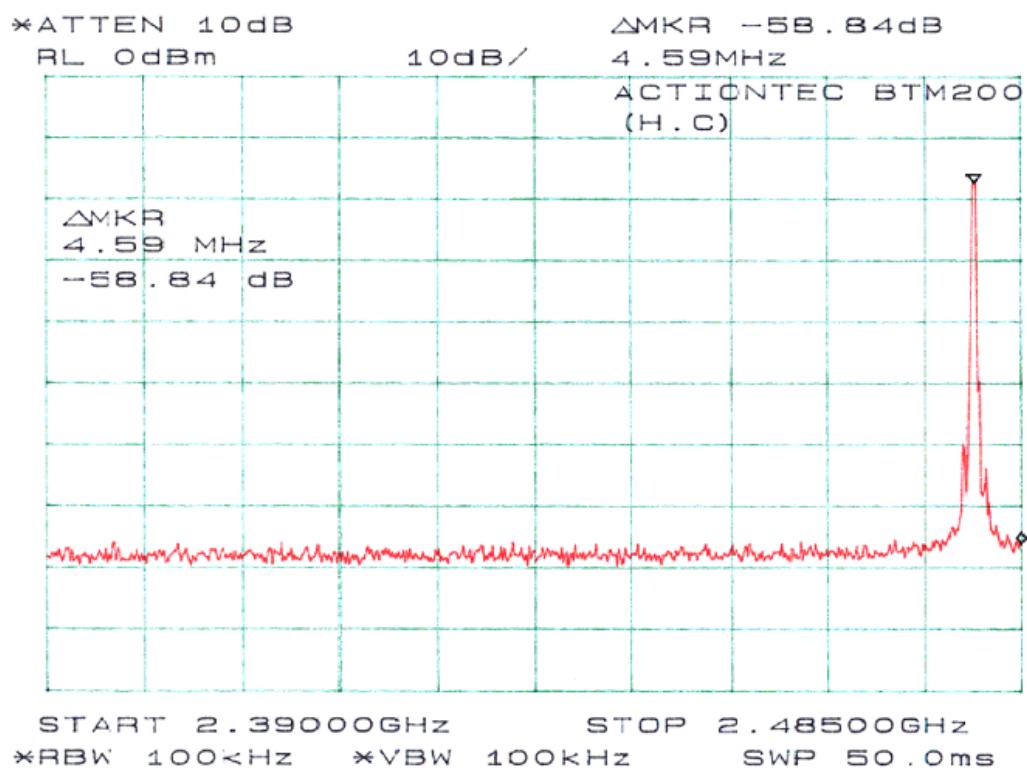

12.2 Band Edge

Requirements:FCC 15.247(c), In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement. Attenuation below the general limits specified in section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in section 15.205(a), must also comply with the radiated emission limits specified in section 15.209(a) (see section 15.205(c)).

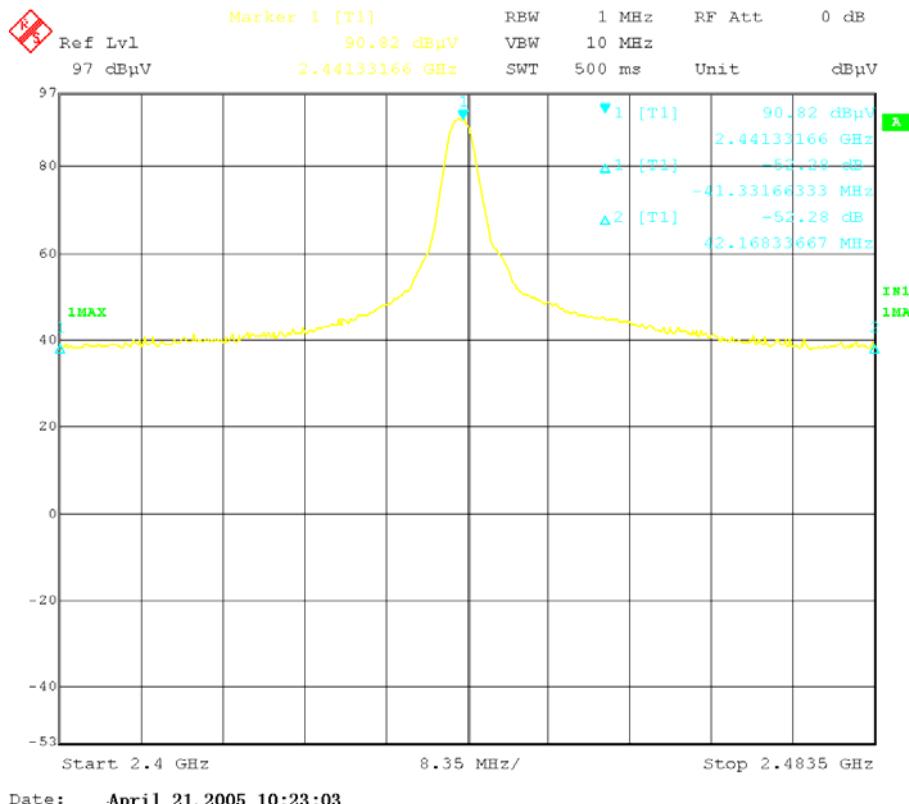

12.3 Test Result

The high Edges:the value is 58.84dBm that is attenuated more than 20dB.

Please fefer the graph as below:

12.4 20dB Bandwidth Test Result

13 Power Spectral Density

Test Requirement:

FCC Part15 Paragraph 15.247

Test Method:

Based on ANSI 63.4

Test Date:

April 21, 2005

Requirements:

Regulation 15.247(d) For direct sequence systems,The peak power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 KHz band during any time interval of continuous transmission.

Test procedure:

The tests below are running with the EUT transmitter set at high power mode.APCMCIA port from a notebook computer to the EUT.The EUT is needed to force selection of output power lever and channel number.While testing, EUT was set ot transmit continuously.A horn antenna was connected with the spectrum analyser.

The EUT is tested in Chamber.Put EUT on the middle of a wooden table.Set spectrum analyzer RBW=3KHz,VBW>RBW(e.g.VBW=10KHz),Span=2 MHz.Turn around the table to find maximum emission.

1. Then set the Span=300KHz and sweep time= 100sec.Peak the maximum emission again.Record the test field strength.
2. Calculate the transmitter's peak power using the following equation:

$$\text{Power} = (E \times d)^2 / (30 \times G)$$

Where:E=the measured maximum field strength in V/m.

Set the RBW>6dB bandwidth of the emission or use a peak power meter.

.G= the numeric gain of the transmitting antenna over an isotropic radiator.

.d= the distance in meters from which the field strength was measured.

.P= the power in watts is the final Maximum Peak Output Power.

The EUT was set transmitting continuously and force selection of output power level and channel number.We'd observed that the peak levels aren't greater than +8dBm limit.

Test Result:

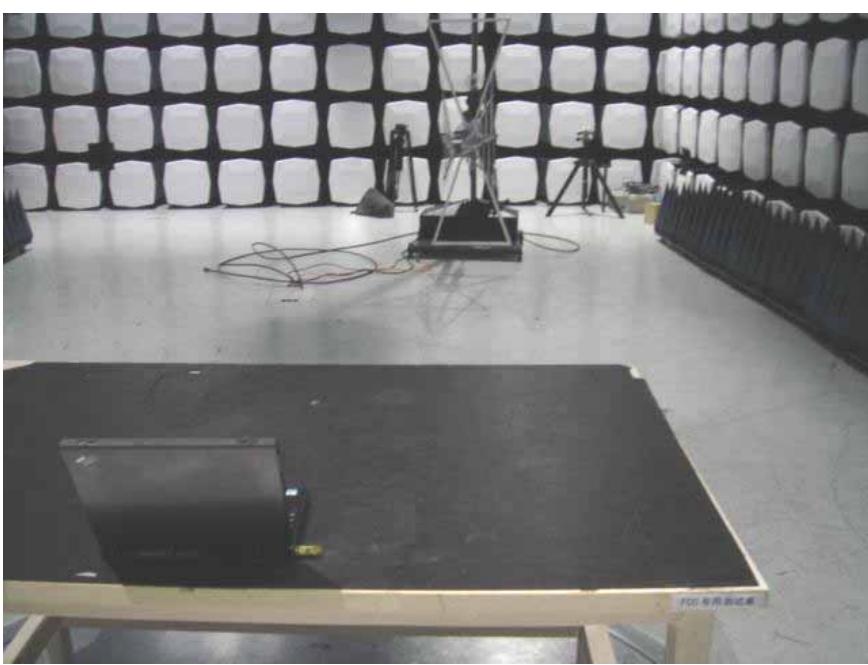

Test Channel	Fundamental Frequency(G Hz)	RF Power level in 3KHz BW Filed Strength(dBuV/m)	Gain(dBi)	RF Power level in 3KHz BW (dBm)	Maximum Limit (dBm)	PASS/FAIL
low	2.402	82.9	+2	-13.33	8.0	PASS
middle	2.441	80.8	+2	-15.43	8.0	PASS
high	2.480	79.6	+2	-16.63	8.0	PASS
